1 I. Introduction

2 I.1. The Medical Physics Expert

3

4 The Medical Physics Expert (MPE) applies physics principles in the medical setting [1, 2, 3, 4, 5]. In the
5 Netherlands the expertise and official requirements for training of the MPE are defined by law [6, 7].

6 The MPE has three main responsibilities:

- 7 1. Quality Assurance: clinical introduction, development, quality assurance of medical
8 technology for diagnosis and treatment, and continuous development of a quality
9 management system. The MPE is also qualified to advise on and act in radiation protection
10 matters and/or other subjects within the domain of physics.
- 11 2. Diagnosis and treatment: the MPE advises on, and is responsible for aspects of, the diagnosis
12 and treatment of individual patients. The MPE is responsible for effective and correct use of
13 medical devices and the correct dose delivery for diagnostics and treatment, both for the
14 individual patient as well as the entire patient group.
- 15 3. Innovation: initiating innovations to improve diagnostics and treatments as well as performing
16 scientific research and translating the results into new methods for diagnosis and treatment.
17 The MPE also determines and develops, together with medical doctors and the hospital
18 management, the strategic and medical-physics policy of the hospital and/or department.

19

20 The field of expertise of the MPE ranges from acquisition, development, innovation, clinical
21 implementation, and quality management of medical technology, to ensuring and optimizing the
22 quality of diagnosis and treatment of individual patients [6, 8, 9]. The common goal is to enable and
23 ensure the optimal, safe, and reliable diagnosis and treatment of patients. For this, expert knowledge
24 on fundamental physics, technical equipment and information technology possibilities, interpretation
25 of diagnostic and therapeutic data, and understanding of characteristics of the patient's disease is
26 required. MPEs play an active role in scientific research and innovation in medical technology aimed
27 at continual improvement of treatment and diagnosis. In patient care, the role of the MPE in the multi-
28 disciplinary medical team varies from primary treatment responsibilities to the responsibility for the
29 safe and correct introduction and use of state-of-the-art medical technology and techniques. The MPE
30 is often responsible for ensuring the radiation safety of patients. In some cases, the MPE has the role
31 of the Radiation Protection Expert (Dutch: Coördinerend Deskundige) and is also responsible for
32 ensuring the radiation safety of hospital staff and the general public.

33 The MPE plays a leading role in the strategic planning, commissioning, and safe use of technology and
34 techniques, and therefore is also actively involved in the continual improvement of diagnostic and
35 treatment techniques and technological advancements.

36

37 In technology-driven medicine, the MPE works in close collaboration with the physician and other
38 technical healthcare professionals such as engineers and technicians. The MPE is the specialist trained
39 in applying fundamental and applied physics, mathematics, and technology in the clinic at an academic
40 level. In some cases, the MPE is responsible for applying medical physics knowledge and skills for the
41 benefit of the individual patient.

42

43 There are four differentiations of MPE in the Netherlands: General Medical Physics (AKF), Audiology
44 (AUD), Radiology and Nuclear Medicine (RNG) and Radiotherapy (RTH).

45

46 A master's in physics or equivalent is a prerequisite to enter the four-year post-master's residency
47 program to become an MPE. Only equivalent Master programs in the Netherlands approved by
48 Stichting OKF are accepted (<https://www.stichtingokf.nl/belangrijke-documenten/geaccepteerde-vooropleidingen/>). [6, article 6]

49

1 I.2. Curriculum

2 The purpose of this document is to describe the Knowledge, Skills, and Competences (KSC) that a MPE
3 needs to achieve during their residency. The KSC are structured in Chapter II in seven fields of expertise
4 (Dutch: kennisgebieden):

- 5 1. The patient: Fundamentals of Human Anatomy, Physiology, Psychophysics, Pathology, and
6 Interacting with Patient
- 7 2. Physics and Engineering in Medicine
- 8 3. Risk Management, Quality Control and Safety in the Medical Environment
- 9 4. Radiation Physics, (Radiation) Protection and Dosimetry
- 10 5. IT and data science
- 11 6. Organisation, management, finance, laws, and ethics in healthcare
- 12 7. Science and Innovation

13 Additionally, this document describes the CanMEDS-roles that the resident must develop. The
14 CanMEDS-roles are described in Chapter III.

15 The resident is requested to implement the curriculum in an individual training plan covering the four-
16 year training period. During this training period the resident reports on progress via several progress
17 reports. To monitor the progress of the MPE resident this curriculum describes several tools:
18 Deliverables, EPAs and an ECTS table. Additionally, the MPE should request feedback in a formal and
19 informal setting.

20
21 Part of the knowledge, skills and competences are acquired in a structured way organized by the
22 cluster, e.g., by internships, education, and clinical rotations. The local specific implementation of the
23 curriculum should be detailed in the cluster curriculum (Dutch: clusterleerplan).

24
25 This curriculum is based on the previous curricula of the Stichting OKF and on the curriculum for
26 medical specialists. Furthermore, the curriculum complies with the Dutch Healthcare Professionals Act
27 (Dutch: Wet op de beroepen in de individuele gezondheidszorg – wet BIG).

28 I.2.a. Knowledge, Skills and Competences & CanMEDS-roles

29 To acquire and maintain sufficient knowledge, skills, and an appropriate level of competence, both
30 initial and continuing education and training are necessary.

31 Chapter II describes the knowledge, skills, and competences that the MPE in training needs to acquire
32 during the four years of training. For each of the fields of expertise, the knowledge, skills, and
33 competences can be defined either for separate differentiations or for a “common trunk” in case they
34 are relevant for all differentiations.

35
36 The knowledge, skills, and competences are defined as follows:

- 37 • Knowledge: The outcome of the assimilation of information through learning or experience;
38 the theoretical, factual, or practical understanding of a subject.
- 39 • Skills (is able to): The ability to apply knowledge to complete tasks and solve problems.
- 40 • Competences: The demonstrated ability (in terms of autonomy and responsibility) to use
41 knowledge, skills and personal, social and/or methodological abilities, in work or study and in
42 professional and personal development.

43
44 Chapter III describes the CanMEDS methodology [10] that describes the development of fundamental
45 roles the MPE can have, similar to the curriculum of medical specialists. For this curriculum, the
46 following CanMEDS-roles are defined: Medical Physics Expert, Collaborator, Communicator, Health
47 Advocate, Leader, Professional and Scholar.

1 I.2.b. Deliverables, EPAs and ECTS

2 In this curriculum, three tools are used to plan and monitor the progress of the resident in a structured
3 way. These are deliverables, EPAs and ECTS. They are defined as follows:
4

5 **Deliverable:** Proof of completing a certain activity, demonstrating the resident's knowledge, or skills
6 or competence. The deliverables are presented in Chapter II for each of the 7 fields of expertise (Dutch:
7 Kennisgebieden). A comprehensive list of deliverables is attached in Appendix V.1. The exact wording
8 of each deliverable is not set in stone and should be seen as strong suggestions. Residents should
9 report deviations and progress of their deliverables in their individual training plan and progress
10 reports.
11

12 **EPA:** An Entrustable Professional Activity (EPA) is a unit of professional practice that can be fully
13 entrusted to a resident, once the resident has demonstrated the necessary competence to execute
14 this activity unsupervised [11]. EPAs are used in monitoring progress for the field of expertise "The
15 Patient" for the Audiology differentiation and are attached in Appendix V.2.
16

17 **ECTS:** European Credit Transfer and Accumulation System.

18 In this curriculum ECTS are used. In this system, 1 ECTS equals 28 hours and 60 ECTS equals 1 year.
19

20 The estimated number of ECTS to be spent per topic is listed in Table 1. These numbers are based on
21 experience and estimate the required time for a typical resident to acquire the minimum amount of
22 knowledge, skills, and competences per topic. As residents have varying backgrounds, it is possible
23 that the estimated amount of time to be spent on the topic for the individual resident is higher or
24 lower than indicated in Table 1. Deviations from the estimated number of ECTS due to individual
25 circumstances should be discussed with the supervisors and indicated in the individual training plan.
26

27 For differentiations RNG and RTH, the field of expertise "Physics and Engineering in Medicine" is
28 broken down in more detailed topics, as can be seen in Table 1. The estimated number of ECTS can be
29 fulfilled in different activities, e.g., self-study, following courses or attending conferences, or more
30 actively, e.g., patient counselling, participating in clinical innovation projects or joining committees
31 (NVKF, NCS). Residents can plan additional activities to develop CanMEDS-roles, e.g., (peer-to-peer)
32 coaching or a course in communication skills. Activities and estimated ECTS should be detailed in the
33 personal training plan (Dutch: opleidingsplan), see Chapter I, Section I.3.a.
34

*Time is reserved for writing the individual training plan (4 ECTS) and progress reports (6 ECTS)
(see*

35 Table 2). To be more flexible in seizing interesting opportunities that emerge in clinical practice, it is
36 recommended to allocate an appropriate number of ECTS (e.g., 3 ECTS per block of 30 ECTS) to
37 unforeseen activities (see Table 2).
38

39 Residents employed by academic institutions are expected to spend a certain amount of time (30 ECTS
40 or more) at an internship at a non-academic institution, and, conversely, residents employed by non-
41 academic institutions should spend 30 ECTS or more in an academic institution (See Table 3).
42 Internships at the 3 other medical physics differentiations (4 ECTS each or more) should be performed
43 to get acquainted with the complete spectrum of medical physics (See Table 3). Time spent during
44 these internships are to be distributed over the seven fields of expertise.
45

46 Furthermore, ECTS in the training plan should be attributed to participation in regular work-related
47 (team/department) meetings or national meetings and conferences related to medical physics.

1 Additionally, active participation in a national or international committee, on behalf of the NVKF or
 2 Stitching OKF is strongly encouraged.

3
 4 Note that the total estimated number of ECTS allocated in Table 1 is significantly lower than the total
 5 number of ECTS for the residency (240 ECTS); the difference in ECTS can be used as desired, on areas
 6 of expertise in each of the differentiations, as a means to personalize the individual training plan.
 7

Table 1: The number of ECTS estimated to acquire the minimum amount of knowledge, skills, and competences per topic, shown for each of the 4 differentiations.

	AKF	AUD	RNG	RT
K1: The patient: Fundamentals of Human Anatomy, Physiology, Psychophysics, Pathology, and Interacting with Patient	6	63	5	6

1

2 I.2.c. Feedback

3 Feedback is a crucial tool during the residency. The MPE is expected to request regular feedback from
 4 their supervisor, colleagues and peers, interdisciplinary teams, and patients. Conversely, the (team of)
 5 supervisors are expected to provide ample (unsolicited) feedback to the resident. There are several
 6 methods for requesting feedback, the resident is encouraged to use the following methods:

- 7 • **Self-assessment and reflection:** The resident is expected to reflect on their progress using self-
 8 assessment and reflection.
- 9 • **Informal feedback:** Feedback is often given in an informal setting. Residents are encouraged
 10 to gather informal feedback often and from a variety of people.
- 11 • **Multisource feedback (MSF or 360-degree assessment):** A questionnaire is sent to multiple
 12 colleagues (observers) to gather feedback about particular competences and skills of the
 13 resident. Observers can include all professionals that are involved in the resident's projects or
 14 activities, such as physicians, nurses, technologists, and medical physicists. MSF encourages
 15 reflection and promotes development of a self-improvement plan.
- 16 • **Encounter cards** (Dutch: Korte Praktijk/Klinische/Deel Beoordeling - KPB, KKB or KDB) are a
 17 type of in-training tool characterised by direct observations that are documented after brief
 18 encounters between an observer or supervisor and the resident in a (clinical) setting. The
 19 encounter card is a method of direct assessment based on a short questionnaire.

20 In the personal training plan, residents should detail how feedback is obtained during the residency.
 21 Clusters should facilitate feedback, describe procedures in the Cluster Curriculum (Dutch:
 22 Clusterleerplan) and provide formats for MSF and encounter cards. Additional format documents and
 23 methods may be found online at:

- 24 • https://nvkf.nl/nl/documenten?field_categorie_tid=24
- 25 • www.royalcollege.ca/rcsite/documents/canmeds/assessment-tools-handbook-e.pdf

26

27 I.3. Individual implementation

28 I.3.a. Training plan

29 Each resident has to design an individual training plan (Dutch: Opleidingsplan) in which the resident
 30 describes the activities planned to acquire the knowledge, skills and competences described in this
 31 curriculum. Additionally, residents should describe how they plan to develop in the CanMEDS-roles.

32 In the training plan, residents should plan activities in blocks of 30 ECTS. Within each block the resident
 33 can plan courses, projects, internships and common activities. The training plan should motivate the
 34 residents' choices on how the estimated number of ECTS are fit in the training plan. It is advised to
 35 plan in larger thematic blocks rather than planning in too much detail. During the residency, changes
 36 or amendments to the initial training plan are to be expected, these are described in the progress
 37 reports. The training plan is written in collaboration with the residents' supervisors and is assessed and
 38 approved by the College of Examination (Dutch: College van Toetsing) of the Stichting OKF.

39 A template of an individual plan can be found online:

40 <https://www.stichtingokf.nl/belangrijke-documenten/formats-opleidingsdocumenten/>.

41 I.3.b. Progress reports

42 The progress in development of knowledge, skills and competences is reported via a progress report
 43 (Dutch: voortgangsverslag). The resident also reflects on the development of CanMEDS-roles during
 44 activities and describes what should be developed additionally before the end of the residency.

1 Changes with respect to the individual training plan should be indicated. If these changes have
2 consequences for the planning of subsequent blocks, a plan should be made describing how
3 knowledge, skills and competences are acquired in subsequent blocks.

4 This report is primarily meant as a portfolio for the resident and is monitored and assessed by the
5 supervisor. The report should be provided eight times during the residency, once per block of 30 ECTS.
6 The approval of the supervisor per block is required for the final exam. The report is sent for evaluation
7 to the College of Examination (Dutch: College van Toetsing).

8

9 A template for the progress report can be found here:

10 <https://www.stichtingokf.nl/belangrijke-documenten/formats-opleidingsdocumenten/>.

11

12 The exam regulations can be found here:

13 <https://www.stichtingokf.nl/belangrijke-documenten/reglementen/>

14

II. Fundamental Knowledge, Skills and Competences

The following sections provide more detail on the required areas of knowledge, skills and specific competences for the MPE.

II.1. The patient: Fundamentals of Human Anatomy, Physiology, Psychophysics, Pathology, and Interacting with Patient

II.1.a. Common Trunk

Short description

The MPE is part of a multidisciplinary team and has a basic knowledge of human anatomy, physiology, psychophysics and pathology; where psychophysics is the scientific study of the relation between stimulus and sensation. The MPE understands diagnostic and treatment-related effects. The MPE communicates effectively with other health professionals and the patient to ensure effective healthcare.

Knowledge, skills and competences

The MPE has knowledge of:

- Relevant human anatomy, physiology, psychophysics and pathology,
- Radiobiology, i.e., the effects of different forms of radiation on cells,
- Basic psychological principles in the practice of medicine,
- The principles of counselling, and
- Fundamentals of patient diagnosis and treatment, and rehabilitation.

The MPE is able to:

- Interact with patients and carers,
- Recognise basic anatomy, physiology and pathology of the major parts and organs of the human body in images created on all radiology or nuclear imaging modalities, and
- Balance the technical quality of treatments as well as the quality of life of the patient, medical considerations and treatment costs.

II.1.b. General Medical Physics

Short description

Advanced knowledge of anatomy, physiology and pathology, beyond the basic curricular requirements, is needed to effectively communicate and operate within a multidisciplinary team involving multiple departments within the hospital.

Knowledge, skills and competences

The MPE has knowledge of:

- The anatomy, physiology and pathology of for instance the cardiovascular system heart and vascular system, lungs, brain and gastrointestinal tract,
- Methods and techniques to assess the function or dysfunction of the organ systems,
- The development of cancer, the nature of the various forms of cancers, and the associated diagnosis and treatment options, including multi-modality options, such as chemotherapy or chemoradiation, surgery, immunotherapy and hormone therapy, as well as High-Intensity

- 1 Focused Ultrasound (HIFU), Photo-Dynamic Therapy (PDT), Radio Frequency Ablation (RFA),
2 hyperthermia, radiotherapy and nuclear therapy, and
3 ● The process of how medical doctors of different specialties come to a diagnosis of a
4 particular pathology.

5
6 The MPE is able to:

- 7 ● Understand the questions and challenges facing medical staff and translate those
8 questions in medical physical terms.

9
10 The MPE is competent to:

- 11 ● Participate/accompany/observe a medical doctor while they do their diagnosis and image
12 analysis, for all major anatomic parts and clinical topics, and
13 ● Identify all major organs in images acquired via medical imaging modalities.

14

15 **II.1.c. Audiology**

16 **Short description**

17 In the Dutch healthcare system, the Audiology MPE is ultimately responsible for the audiological care
18 given to patients. As such, the MPE must have a thorough understanding of the anatomy, physiology
19 and pathology of the ear and vestibular system, and must be able to:

- 20 ● Form a diagnosis and rehabilitation plan,
21 ● Participate in multidisciplinary teams in which diagnoses and rehabilitation options are
22 evaluated,
23 ● Supervise and educate other healthcare professionals,
24 ● Communicate with patients in a clear and understandable way, and
25 ● Effectively and efficiently manage patient care, without losing sight of the purpose and
26 suitability of a therapy or treatment.

27 In short, the MPE must be able to determine what care is necessary, appropriate and sufficient, in the
28 context of multidisciplinary patient care.

29

30 **Knowledge, skills and competences**

31 The MPE has knowledge of:

- 32 ● The anatomy, physiology and pathology of the outer, middle and inner ear, and of the
33 vestibular system as well as the innervation of the labyrinth and the pathways to the brain,
34 ● Speech and language development and the associated disorders,
35 ● Personal and environmental factors influencing the affliction and/or participation
36 capabilities of the patient,
37 ● The psychosocial aspects that can accompany hearing and communication disorders,
38 ● The diagnostic and treatment options provided by the other health care professionals in
39 the multidisciplinary team, and
40 ● The technical and non-technical treatment options.

41

42 The MPE is able to:

- 43 ● Interpret referrals of healthcare professionals and refer patients to other healthcare
44 professionals,
45 ● Conduct an anamnesis,
46 ● Formulate a patient's request for help,
47 ● Formulate a treatment plan based on the diagnostic data.
48 ● Deliver bad news in a compassionate and appropriate manner,
49 ● Inform and counsel patients and discuss treatment options in suitable, clear language and
50 in accordance with their emotional state or state of mind,

- 1 ● Work with patients with special needs, with an awareness of the guidance and educational
- 2 possibilities for these patients,
- 3 ● Provide a recommendation to a patient or insurance company,
- 4 ● Refer to further care when necessary,
- 5 ● Maintain a proper patient file, and
- 6 ● Supervise other members of a multidisciplinary team to carry out the above-mentioned
- 7 activities.

8

9 **EPAs**

10 In audiology, each resident has to show to be able to conduct all of the above-mentioned skills in a
11 system of multiple Entrustable Professional Activities (EPAs), comprising different categories of
12 audiological care. These EPAs are listed below and can be found in Appendix V.2:

- 13 8. Hearing diagnosis in adults,
- 14 9. Hearing rehabilitation and audiological care in adults (mainly via hearing aids or bone
15 conduction devices),
- 16 10. Hearing diagnosis in children and infants,
- 17 11. Hearing rehabilitation and audiological care in children and infants,
- 18 12. Cochlear implants in adults,
- 19 13. Cochlear implants in children and infants,
- 20 14. Vestibulology,
- 21 15. Speech and language development in children, and
- 22 16. Tinnitus.

23 All these EPAs are addressed throughout the four years of training within the standard clinical care of
24 the training institute, using different levels of supervision, working from supervision level 1 to 3, 4 or
25 5, depending on the EPA.

26

27 Levels of supervision:

- 28 1. The resident observes (does not act).
- 29 2. The resident acts under direct, proactive supervision (supervisor is present).
- 30 3. The resident acts under indirect, reactive supervision (supervisor not present, but available
31 when needed).
- 32 4. The resident is competent to act without supervision.
- 33 5. The resident supervises the activity.

34

35 **II.1.d. Radiology and Nuclear Medicine**

36 **Short description**

37 Advanced knowledge of anatomy, physiology and pathology is required to effectively communicate
38 and operate in a multidisciplinary team in the departments of radiology and nuclear medicine, and to
39 recognise and understand the underlying anatomy, physiology and pathology shown in the images
40 produced by the different modalities.

41

42 **Knowledge, skills and competences**

43 The Radiology and Nuclear Medicine MPE has knowledge of:

- 44 ● Various treatment options,
- 45 ● Radiobiology, including effects of different forms of radiation on cells, differences between
46 external beam radiotherapy, brachytherapy and radionuclide therapy, and the effects of
47 different types of ionising radiation,
- 48 ● The development of cancer, the nature of the various forms of cancers, and the associated
49 diagnosis and treatment options, including multi-modality options, such as chemotherapy or
50 chemoradiation, surgery, immunotherapy and hormone therapy, as well as High-Intensity

- 1 Focused Ultrasound (HIFU), Photo-Dynamic Therapy (PDT), Radio Frequency Ablation (RFA),
2 hyperthermia, radiotherapy and nuclear therapy,
3 ● Fundamentals of cellular, molecular and tumour biology,
4 ● Deterministic and stochastic effects of ionising radiation, and
5 ● Principles of diagnostics and staging of cancer.
6

7 The Radiology and Nuclear Medicine MPE is able to:

- 8 ● Identify the basic anatomy, physiology and pathology of the major parts of the body in
9 images created on all radiology or nuclear imaging modalities,
10 ● Apply a practical understanding of the process of how a radiologist comes to a diagnosis of
11 different pathologies, and
12 ● Translate the questions and challenges facing medical staff into medical physical terms.
13

14 The Radiology and Nuclear Medicine MPE is competent to:

- 15 ● Participate/accompany/observe radiologist while they do their diagnosis and image analysis,
16 for all major anatomic parts and clinical concerns in order to help improving diagnosis.

17 **II.1.e. Radiotherapy**

18

19 **Short description**

20 In order to effectively communicate and operate within the multi-disciplinary team, an understanding
21 of the fundamentals of cancer development, diagnostics and treatment is required. Knowledge of
22 radiobiological principles and the effects of radiotherapy and multimodality treatments is also
23 essential.
24

25 **Knowledge, skills and competences**

26 The MPE has knowledge of:

- 27 ● The development of cancer, the nature of the various forms of cancers and their molecular
28 and cellular features, as well as diagnostics of cancer,
29 ● Different tumour sites and treatment options including multi-modality options such as
30 chemotherapy or chemoradiation, surgery, immunotherapy and hormone therapy, as well as
31 alternative or complementary treatment modalities such as High-Intensity Focused Ultrasound
32 (HIFU), Radio Frequency Ablation (RFA) and hyperthermia,
33 ● Radiotherapy treatment options including radiation schemes and clinical outcomes,
34 ● Radiobiological background of treatment strategies in radiation therapy,
35 ● Fundamentals of radiobiological models in radiotherapy, and the application and limitations
36 of these models,
37 ● Dose-response analysis from clinical data and patient cohorts,
38 ● Fundamentals of cellular, molecular and tumour biology,
39 ● Deterministic and stochastic effects of ionising radiation,
40 ● Effects of fractionation, dose rate, radio sensitization and reoxygenation, and
41 ● Principles of diagnostics and staging of cancer.
42

43 **Deliverables**

- 44 1. Follow the treatment chain for curative treatment from multidisciplinary tumour board to first
45 treatment fraction for one patient.
46

1 II.2. Physics and Engineering in Medicine

2 II.2.a. Common Trunk

3 Short description

4 An MPE is an expert on the physics and engineering of medical devices and is aware of possibilities,
5 limitations and pitfalls of their clinical application. The MPE values developments in design and
6 functionality of these medical devices and communicates necessary or desired improvements to
7 vendors/producers. Within the multi-disciplinary team, it is the role of the MPE to ensure that
8 equipment used in the diagnosis or treatment process is used appropriately, effectively and safely. In
9 addition, the MPE understands the acquisition process and interpretation of data from the various
10 modalities.

11 Knowledge, skills and competences

12 The MPE has knowledge of:

- 13 ● Physics and engineering principles of medical devices used for diagnostics, therapy, functional
14 support and patient monitoring in the hospital environment (as described in more detail in
15 sections for the differentiations),
- 16 ● Anatomical and functional imaging acquired with different modalities and techniques,
- 17 ● CT, MRI, ultrasound and PET imaging devices, sources of image artefacts, image uncertainties
18 and the resolution limits,
- 19 ● The physics and principles of the different imaging modalities and the effects of the acquisition
20 and reconstruction parameters on the appearance and the properties of an image,
- 21 ● Effects and management of patient organ motion in imaging, and
- 22 ● Image and Data handling, digital image processing, reconstruction algorithms, patient data
23 management systems.

24 The MPE is able to:

- 25 ● Participate in technical discussions with engineers (e.g., discussions on recalibration or
26 replacement of parts),
- 27 ● Participate in discussions with the end-users of the equipment (e.g., discussions on proper
28 usage and technical limitations of usage), and
- 29 ● Initiate and support training, education and research on medical equipment.

30 The MPE is competent to:

- 31 ● Independently perform or participate in acceptance tests/commissioning/calibration for
32 medical devices and medical rooms.

33 Deliverables

- 34 1. Write a recommendation for development/adjustment of a medical device or procedure that
35 is in clinical use.

36
37
38

39 II.2.b. General Medical Physics

40 Short description

41 The General MPE is able to advise management and staff on which type of technique or equipment
42 should (or should not) be procured or used for specific applications. In order to function as an expert
43 and to effectively communicate and operate within a multi-disciplinary team, a thorough

1 understanding of the physics and engineering of medical devices is required. The General MPE is
2 responsible for the safe and effective operation of medical devices. Specific requirements in medical
3 imaging include optimising image quality in relation to radiation dose, acquisition time or acquisition
4 parameters, and knowledge of state-of-the-art imaging techniques.

5
6 All lifecycle phases of medical devices should be fully understood, including selection, room design,
7 acceptance, calibration, safety and quality assurance, optimisation, and decommissioning.
8 Furthermore, the General MPE is capable of initiating and supporting training, education and
9 research and is proactive in giving advice on new applications of medical devices in clinical practice.

10 11 **Knowledge, skills and competences**

12 The General MPE has knowledge of

- 13 ● Basic physics principles and working mechanisms, and safety aspects of at least the following
14 devices:
 - 15 ○ Ventilator devices,
 - 16 ○ Monitoring devices,
 - 17 ○ Infusion pumps,
 - 18 ○ Electro surgery,
 - 19 ○ All imaging modalities on radiology and nuclear medicine departments
 - 20 ○ All ultrasound equipment throughout the hospital,
 - 21 ○ All devices used in areas of intensive care and monitoring (ICU, CCU, BCU, ER and
22 OR), and
 - 23 ○ All lasers and ultraviolet radiation equipment.
- 24 ● Signal analysis algorithms used typically in these devices,
- 25 ● Signal processing and data acquisition techniques (hard- and software),
- 26 ● Typical parameters settings of these devices,
- 27 ● Current state-of-the-art and future developments of medical technology in several medical
28 specialties,
- 29 ● Principles of interaction between ionising and non-ionising radiation and matter,
- 30 ● MR safety,
- 31 ● Operating image acquisition systems,
- 32 ● Image reconstruction algorithms,
- 33 ● The effect of imaging parameters on image quality, dose and acquisition time,
- 34 ● Principles of electrical safety, and
- 35 ● Principles of medical gas safety.

36
37
38 For detailed descriptions of knowledge, skills and competences on devices used in radiology and
39 nuclear medicine, please refer to Section II 2.3, the section for Radiology and Nuclear Medicine.
40 These descriptions can serve as an inspiration for in-depth projects with a specific device for a
41 resident in General Medical Physics (Dutch: Algemene Klinische Fysica - AKF).

42 43 **Deliverables**

- 44 1. Independently perform or participate in acceptance tests/commissioning/calibration for
45 at least 3 medical devices, at least at the following locations: Radiology/Nuclear Medicine,
46 OR/ICU, and Functional Monitoring (e.g. Cardiology or Audiology).
- 47 2. Advise in the building/room design requirements, determine electrical safety
48 requirements and perform acceptance tests for medical rooms, specifically concerning
49 ionising and Electromagnetic radiation protection.

1 **II.2.c. Audiology**

2 **Short description**

3 As a leader of the audiological centre and as a caregiver the Audiology MPE needs to have a knowledge
4 of the physics and engineering of the audiological devices that are used for diagnostics and must be
5 aware of possibilities and pitfalls in their clinical application. They also need a thorough understanding
6 of the function and limitations of all types of hearing aids and other devices that support
7 communication. Furthermore, they must be able to administer and adjust these devices and be able
8 to teach others to perform these tasks. They must be able to value developments in design and
9 functionality of these medical devices, and to communicate necessary or desired adjustments to
10 vendors and producers.

11
12

13 **Knowledge, skills and competences**

14 The Audiology MPE has knowledge of:

- 15 ● The physical properties of hearing aids, bone conduction devices and cochlear implants, and
16 how these properties can be used to benefit the patient,
- 17 ● Appropriate amplification models for hearing aids and bone conduction devices, and how to
18 apply these models in the various devices, and
- 19 ● Appropriate stimulation models for cochlear implants, and how to apply these models in
20 different implants.

21 The Audiology MPE is able to:

- 22 ● Perform and teach the following audiological diagnostic measurements in adults:
 - 23 ○ Pure tone audiometry,
 - 24 ○ Speech audiometry (such as Pure tone, speech and Visual Reinforcement Audiometry),
 - 25 ○ Speech in noise audiometry,
 - 26 ○ Tympanometry and acoustic reflex measurements,
 - 27 ○ Otoacoustic emissions (OAEs), and
 - 28 ○ Brainstem Evoked Response Audiometry (BERA).
- 29 ● Perform and teach the following specific audiological measurements in children and infants:
 - 30 ○ BERA and Auditory Steady State Responses (ASSR),
 - 31 ○ Otoacoustic emissions (OAEs),
 - 32 ○ Tympanometry,
 - 33 ○ Conditioned Play Audiometry (CPA),
 - 34 ○ Visual Reinforcement Audiometry (VRA),
 - 35 ○ Behavioural Observation Audiometry (BOA),
 - 36 ○ Speech audiometry, and
 - 37 ○ Speech in noise audiometry.
- 38 ● Perform and interpret performance tests on various hearing aids and bone conduction devices,
- 39 ● Perform and interpret response measurements on cochlear implants,
- 40 ● Verify the amplification of hearing aids with Real Ear Measurements (REM), including:
 - 41 ○ Verification of the various output parameters by means of real ear insertion gain, real
42 ear aided gain, real ear aided response, et cetera, and
 - 43 ○ Verification by means of simulated real ear measurements in a 2cc coupler using RECD
44 measurements.
- 45 ● Validate various hearing devices using:
 - 46 ○ Free field tone- and speech audiometry, and
 - 47 ○ Free field speech in noise audiometry
- 48 ● Calibrate different audiological diagnostic devices, and
- 49 ● Measure sound (exposure), room acoustics and speech transmission.

50
51

1 **Deliverables**

- 2 1. Independently perform or participate in acceptance tests/commissioning/calibration of an
3 audiometer and deliver a calibration report.
4 2. Perform or participate in an acceptance test of a sound booth/audiometry room.

5 **II.2.d. Radiology and Nuclear Medicine**

6 The Radiology and Nuclear Medicine MPE is a trained expert in the field of diagnostic imaging and
7 image guided therapy. Besides expert knowledge on the physics and engineering of the components
8 across the imaging chain, the Radiology and Nuclear Medicine MPE has in depth knowledge of the
9 technical and safety requirements of the medical devices used in conjunction to the imaging and
10 therapeutic applications.

11
12 The Radiology and Nuclear Medicine MPE:

- 13 • Is responsible for safe and effective operation of imaging equipment,
14 • Is capable of optimising image quality in relation to radiation dose, acquisition time and
15 acquisition parameters,
16 • Has knowledge of state-of-the-art techniques, and
17 • Is proactive in advising on new imaging possibilities.

18

19 In addition, the Radiology and Nuclear Medicine MPE:

- 20 • Plays an important role in training, education and research,
21 • All lifecycle phases of an imaging modality should be fully understood, including selection,
22 room design, acceptance, calibration, safety and quality assurance, optimisation, and
23 decommissioning,
24 • Understands and applying the physics and principles of the whole 'imaging chain' for all
25 modalities, that includes acquisition, reconstruction, processing, displaying and post-
26 processing, and
27 • Understands clinical application of imaging modalities and its role in patientcare.

28

29 **Deliverables**

- 30 1. Independently perform or participate in acceptance tests/commissioning/calibration for
31 each of the five large modalities (SPECT/PET/Fluoroscopy/MRI/CT).
32 2. Perform protocol optimization on a radiological or nuclear imaging modality.
33 3. Guide the introduction of a software application in the field of RNM (such as AI tool for
34 reconstruction, images analysis project).
35 4. Deliver education to medical disciplines on image techniques.
36 5. Advise in the building/room design requirements, determine electrical safety
37 requirements and perform acceptance tests for medical rooms, specifically concerning
38 Ionising and Electromagnetic radiation protection.

39

40 **Equipment in general**

41 **Short description:**

42 Some technology or methodology is used in multiple imaging and therapeutic equipment. This chapter
43 describes the general concepts necessary for a Medical Physicist in the field of Radiology and Nuclear
44 Medicine. For simplicity, all general knowledge, skills and competences for modalities are described in
45 this section leaving only the specific knowledge, skills and competences for the individual modalities.

46

47 **Knowledge, skills and competences**

48 The Radiology and Nuclear Medicine MPE has knowledge of:

- 49 • The physics of all imaging modalities to the level that the resident can teach other medical
50 professions,

- 1 ● The different applications of each modality,
- 2 ● The relationships between components of each modality and the contribution of each
- 3 component in the imaging chain,
- 4 ● X-ray tubes (including hardware and specifics of x-ray spectra),
- 5 ● Principles of interaction between radiation and matter,
- 6 ● The operating principles of different detectors,
- 7 ● The effects of imaging parameters on image quality, dose and acquisition time,
- 8 ● Relevant laws, reports and guidelines, and
- 9 ● Protocols and phantoms for quality control.

10

11 The Radiology and Nuclear Medicine MPE is able to:

- 12 ● Identify and interpret artefacts in images, and advise on the clinical impact and risks and
- 13 how to these can be mitigated,
- 14 ● Understand how radiological reporting is done on a broad range of diagnostic questions
- 15 and modalities: implement with short clinical internships by observing reporting of
- 16 radiologists,
- 17 ● Operate image acquisition systems, and
- 18 ● Advise on the room specifications for safe use of imaging equipment.

19

20 The Radiology and Nuclear Medicine MPE is competent to:

- 21 ● Perform all aspects of the introduction of new imaging equipment, and
- 22 ● Optimise image quality.

23

24 **Peripheral Equipment**

25 **Short description**

26 Numerous medical devices are involved in the workflow of the departments of radiology and nuclear
27 medicine. The Medical Physics Expert should have enough knowledge and skills to take responsibility
28 for the safe utilisation of these devices.

29

30 **Knowledge, skills and competences**

31 The Radiology and Nuclear Medicine MPE has knowledge of:

- 32 ● The technology of the equipment used in combination with imaging devices, specifically:
 - 33 ○ Contrast Injectors in different applications (Angiography, CT, MR),
 - 34 ○ Physiological Monitoring: e.g. ECG, heart rate (prospective and retrospective gating),
 - 35 respiration, apnoea, (non) invasive blood pressure, cardiac output, O₂-CO₂ saturation
 - 36 (e.g. sedation and anaesthesia by MR imaging), temperature monitoring (MR),
 - 37 arrhythmia and telemetry (MR),
- 38 ● Gamma probes, and
- 39 ● Dose calibrators.

40 **II.2.d.i. Computed Tomography**

41 **Knowledge, skills and competences**

42 The Radiology and Nuclear Medicine MPE has knowledge of:

- 43 ● The principles, methodologies and algorithms of image reconstruction.

44

45 The Radiology and Nuclear Medicine MPE is able to:

- 46 ● Recognise the differences between and limitations of different CT apparatuses (such as
- 47 spectral CT, cone-beam CT and conventional CT), and
- 48 ● Recognise common CT artefacts.

49

50 The Radiology and Nuclear Medicine MPE is competent to:

- 1 • Optimise patient imaging protocols with respect to image quality, patient radiation- and
- 2 contrast-dose,
- 3 • Advise on common CT artefacts, and
- 4 • Create a safe working environment for imaging activities, including CT-guided punctures
- 5 and biopsies.

6 **II.2.d.ii. Magnetic Resonance Imaging**

7 **Knowledge, skills and competences**

8 The Radiology and Nuclear Medicine MPE has knowledge of:

- 9 • The physics of MRI signal transmission and detection,
- 10 • Acquisition parameters and their effect on the MR image,
- 11 • Imaging and contrast effects T1, T2, T2*, PD, DWI, velocity, flow, susceptibility and
- 12 diffusion,
- 13 • Acquisition methods and techniques (including K-space sampling schemes and fast
- 14 acquisition),
- 15 • The principles, methodologies and algorithms of image reconstruction,
- 16 • MR technology, including RF-coils, the magnet and gradient systems,
- 17 • Different applications, such as diagnosis and therapy planning (radiotherapy, neuro
- 18 navigation), and
- 19 • Principles, classification, safety/risks and use of MR contrast agents.

20

21 The Radiology and Nuclear Medicine MPE is able to:

- 22 • Advice on a safe MRI-room, including magnetic field containment and Faraday cage,
- 23 • To judge MR safety for patient contraindications and 3rd company devices, and
- 24 • Recognise common MR artefacts.

25

26 The Radiology and Nuclear Medicine MPE is competent to:

- 27 • Advice on safe scanning of patients with implants,
- 28 • Filling role of MR safety expert in the hospital, and
- 29 • Advise on artefacts created by image acquisition and reconstruction.

30

31 **II.2.d.iii. Positron Emission Tomography (PET/CT)**

32 **Knowledge, skills and competences**

33 The Radiology and Nuclear Medicine MPE has knowledge of:

- 34 • PET radioisotopes and tracers used,
- 35 • Specific PET image reconstruction algorithms and all corrections applied,
- 36 • Clinical indications and protocols for PET: oncology, cardiac, neurology, radiotherapy,
- 37 • Data acquisition: singles, randoms, noise equivalent count rate, list mode, sinogram mode,
- 38 and,
- 39 • Specific PET image reconstruction items: iterative methods (ML-EM), LOR-reconstruction,
- 40 Time-of-Flight, Point Spread Function correction. Corrections and pre-processing,
- 41 corrections for: geometry, normalisation, attenuation, scatter, randoms, dead time, decay,
- 42 point spread, motion.

43

44 The Radiology and Nuclear Medicine MPE is able to:

- 45 • Recognise common PET/CT artefacts.

46

47 The Radiology and Nuclear Medicine MPE is competent to:

- 48 • Advise on artefacts created by image acquisition and reconstruction.

1 **II.2.d.iv. Single-photon emission tomography (SPECT/CT)**

2 **Knowledge, skills and competences**

3 The Radiology and Nuclear Medicine MPE has knowledge of:

- 4 • SPECT radioisotopes and tracers used,
- 5 • Specific SPECT image reconstruction algorithms and all corrections applied,
- 6 • Quantification methods in planar and SPECT imaging, and
- 7 • Specific SPECT image reconstruction items: Corrections and pre-processing, corrections for
- 8 geometry, normalisation, attenuation, scatter, dead time, decay, point spread, motion.

10 The Radiology and Nuclear Medicine MPE is able to:

- 11 • Recognise common SPECT/CT artefacts.

13 The Radiology and Nuclear Medicine MPE is competent to:

- 14 • Advise on artefacts created by image acquisition and reconstruction.

16 **II.2.d.v. Isotopes, tracers and the radionuclide laboratory**

17 **Short description**

18 At the basis of molecular imaging lie the radiolabelled molecules that mark a specific physiological
19 process of the body.

21 **Knowledge, skills and competences**

22 The Radiology and Nuclear Medicine MPE has knowledge of:

- 23 • Isotope production methods: reactor, cyclotron, linear accelerators, generators,
- 24 • Properties and applications of the different tracers,
- 25 • Tracers synthesis: theory and practical aspects, including quality control,
- 26 • Production of positron emitters (F-18 targetry, C-11, O-15, N-13, Ga-68, Rb-82, Cu-
- 27 61/62/64),
- 28 • Dose calibrators: quality control, calibration,
- 29 • Practical safety procedures in radionuclide laboratory, incl. relevant guidelines, and
- 30 • Regulatory laws and guidelines applicable to production and handling of radioactive
- 31 tracers in the hospital.

33 The Radiology and Nuclear Medicine MPE is able to:

- 34 • Be an expert in the physical properties of the different radioactive isotopes and tracer-
- 35 molecules affecting imaging, and
- 36 • Be an expert in the dosimetry and the possibilities for quantification.

38 The Radiology and Nuclear Medicine MPE is competent to:

- 39 • Be an expert in the design, work processes and regulations surrounding radionuclide
- 40 laboratories.

42 **II.2.d.vi. Radiography, mammography, fluoroscopy and bone densitometry**

43 **Knowledge, skills and competences**

44 The Radiology and Nuclear Medicine MPE has knowledge of:

- 45 • Specific application, indications, benefits and pitfalls,
- 46 • Projections, image magnification, scatter and scatter rejection, both digital as with scatter
- 47 grid,
- 48 • The principles, methodologies and algorithms of (tomographic) image reconstruction,

- 1 • Differences between conventional, mammography, chest radiography and fluoroscopy,
- 2 • Different fluoroscopy configurations (floor, ceiling mounted, mobile, bi-plane C-arms),
- 3 • Relation to other fluoroscopy techniques, including:
 - 4 ○ CT fluoroscopy,
 - 5 ○ MR-fluoroscopy,
- 6 • Different modes of operation in fluoroscopy (continuous, pulsed, averaging, last frame
- 7 hold, road mapping, CT-mode),
- 8 • Specific resolution requirements in digital mammography, digital tomosynthesis,
- 9 stereotactic puncture,
- 10 • Breast cancer screening program and the role of the LRCB,
- 11 • Diagnostic reference levels and dose assessment,
- 12 • Dual energy x-ray absorptiometry principles,
- 13 • Theory and operation of DEXA equipment and the other techniques for bone density
- 14 estimation: quantitative CT,
- 15 • Basic introduction to osteoporosis, bone physiology and risk factors.

16

17 The Radiology and Nuclear Medicine MPE is able to:

- 18 • Apply these techniques in different labs: genitourinary, peripheral vascular and cardiac
- 19 angiography, cardiac electrophysiology, neurovascular imaging and interventions, and
- 20 • Recognise common artefacts.

21

22 The Radiology and Nuclear Medicine MPE is competent to:

- 23 • Advise on artefacts created by image acquisition and reconstruction.

24 **II.2.d.vii. Ultrasound**

25 **Knowledge, skills and competences**

26 The Radiology and Nuclear Medicine MPE has knowledge of:

- 27 • Principle, working mechanism and application of ultrasound,
- 28 • The principles, methodologies and algorithms of image reconstruction,
- 29 • Transducer techniques and systems,
- 30 • Doppler, colour Doppler,
- 31 • (Differential) harmonic imaging,
- 32 • Contrast agents,
- 33 • IVUS, and
- 34 • 3D ultrasound.

35

36 The Radiology and Nuclear Medicine MPE is able to:

- 37 • Recognise common echo artefacts.

38

39 The Radiology and Nuclear Medicine MPE is competent to:

- 40 • Advise on artefacts created by image acquisition and reconstruction.

41

42 **II.2.d.viii. Quantitative image analysis and diagnostic monitors**

43 **Short description**

44 Quantitative image analysis is an expanding area in radiology and nuclear medicine.

45 Finally the 'diagnostic imaging chain' ends with displaying the image on a diagnostic monitor and the

46 image perception of the observer. This crucial final step also needs to be fully understood by the

47 Medical Physics Expert.

48

1 **Knowledge, skills and competences**

2 The Radiology and Nuclear Medicine MPE has knowledge of:

- 3 • The underlying principles of image processing techniques applied to medical images,
- 4 • Quantification in PET: SUVs, Patlak analysis, input function, tumour tracking software,
- 5 basics of pharmacokinetic modelling,
- 6 • Factors influencing the visual perception of an image on a medical display,
- 7 • The difference between displays for primary diagnosis and clinical review,
- 8 • The differences between images and display criteria of different modalities (MRI, CT etc),
- 9 and
- 10 • The characteristics of images: compression, post processing, matrix- and pixel- size, bit
- 11 depth.

12

13 The Radiology and Nuclear Medicine MPE is able to:

- 14 • Use Computer Aided Diagnoses (CAD), clinical decision support systems and applications
- 15 of AI in radiology and nuclear medicine,
- 16 • Write and test the image processing routines in an interactive programming environment,
- 17 and effectively apply them to selected clinical problems,
- 18 • Make recommendations concerning selection of displays during purchasing process, and
- 19 • Make specific recommendations for viewing images of different modalities.

20

21 The Radiology and Nuclear Medicine MPE is competent to:

- 22 • Perform software validation (for image processing),
- 23 • Advise on artefacts created by image acquisition and reconstruction,
- 24 • Optimise and validate the quantification of biomarkers, such as:
 - 25 ○ Determination of stenose grade by angiography, ultrasound and CT,
 - 26 ○ Cardiac function by ultrasound, DSA, cardio angiography, cardio CT and MRI,
 - 27 ○ Dynamic contrast enhancement by MRI, CT and ultrasound, and
- 28 • Measure and optimise viewing conditions.

29

30 **II.2.d.ix. Therapy**

31 **Short description**

32 The combination of imaging and therapy becomes more abundant. These include therapies using

33 ionising radiation (nuclide therapies, image guided radiotherapy) and therapies based on different

34 physical techniques, e.g. different forms of ablation.

35 In nuclear medicine radioactive isotopes and tracers are used to target specific regions, organs or cells

36 in the body. These radiopharmacoons are used for curing diseases and for palliative therapy.

37 Ablative treatments are used to achieve optimal coverage of the tumour, while minimising

38 involvement of surrounding tissue. Image guidance, target definition and dose monitoring are

39 common features of all these techniques. An understanding of the relation between tumour cell kill

40 and the probability of achieving local control is essential.

41

42 **Knowledge, skills and competences**

43 The Radiology and Nuclear Medicine MPE has knowledge of:

- 44 • The principles, methodology, techniques and different radionuclides used in radionuclide
- 45 therapy:
 - 46 ○ Radiopharmaceuticals uptake and retention,
 - 47 ○ Uptake measurements,
 - 48 ○ Calculation of the therapeutic activity and resulting patient dose,
 - 49 ○ Selective internal radiation therapy,
 - 50 ○ Different therapeutic and diagnostic tracers/applications,

- 1 ○ Dosimetry software tool, and
- 2 ○ dose-effects curves of different radiation therapies.
- 3 • Different ablation techniques in relation to imaging, including:
- 4 ○ High-Intensity Focused Ultrasound (HIFU),
- 5 ○ Radio Frequency Ablation (RFA), and
- 6 ○ laser- and Cryo-ablation.
- 7 • Understand interventional radiology and cardiology topics:
- 8 ○ Stenting, and
- 9 ○ PCI.
- 10 • The use of image information in therapeutic treatment planning by other departments,
- 11 and
- 12 • Image guided radiotherapy.

13

14 The Radiology and Nuclear Medicine MPE is able to:

- 15 • Calculate patient or organ dose,
- 16 • Advise on treatment plans for therapies both with ionising radiation and other ablation
- 17 techniques,
- 18 • Taking responsibility for patient individual dosimetry and treatment planning of
- 19 radionuclide therapies,
- 20 • Understand applications for 3D printing in surgical planning,
- 21 • Understand use of image information for treatment planning:
- 22 ○ Neuronavigation,
- 23 ○ Stereotactic neurosurgery,
- 24 ○ Radiotherapeutic treatment planning,
- 25 ○ 3D presentations for surgery, and
- 26 ○ Orthopaedic planning and image guidance.

27

28 The Radiology and Nuclear Medicine MPE is competent to:

- 29 • Take responsibility for patient dosimetry and safety, as is specified in Dutch regulations (Bbs),
- 30 and
- 31 • Take responsibility for the safe use of therapy in combination with MR.
- 32 • Take responsibility for the safe use of lasers.

33

34

35 **II.2.e. Radiotherapy**

36 **II.2.e.i. Treatment equipment for external radiotherapy**

37 **Short description**

38 The Radiotherapy MPE is responsible for the installation, maintenance, and safe and effective
39 operation and de-installation of all radiotherapy equipment, including the integrated imaging systems
40 to position and localise the target on-line before and/or during the treatment.

41

42 **Knowledge, skills and competences**

43 The Radiotherapy MPE has knowledge of:

- 44 • Physics and principles of radiotherapy treatment units (including linear accelerators,
- 45 GammaKnife, Cyberknife, proton therapy, MR-linac and orthovoltage systems),
- 46 • In-room imaging equipment (including CBCT, kV and MV imaging, MR imaging on the MR-linac,
- 47 and surface guided radiotherapy),

- 1 ● Dosimetric and mechanical parameters of the radiotherapy treatment units and their
2 interlocks.

3

4 The Radiotherapy MPE is able to:

- 5 ● Operate treatment units and in-room imaging equipment,
6 ● Communicate with engineers (e.g., concerning recalibration or replacement of parts), and
7 ● Understand the engineering, maintenance and quality control of the treatment and imaging
8 equipment.

9

10 The Radiotherapy MPE is competent to:

- 11 ● Commission treatment machines and decide whether treatment machines can be clinically
12 used.

13

14 **Deliverables**

- 15 1. Perform acceptance testing and commissioning of a treatment unit, treatment planning
16 system or imaging modality (MRI, CT) that is used for radiotherapy simulation.

17

18 **II.2.e.ii. Treatment simulation and planning**

19 **Short description**

20 The Radiotherapy MPE plays a key role in the entire treatment planning procedure, both for
21 conventional and online adaptive workflows, and is responsible for the acceptance, commissioning
22 and maintenance of the Treatment Planning System (TPS). The Radiotherapy MPE is responsible for
23 the effective use of CT, MRI and PET devices. The Radiotherapy MPE has expert knowledge of dose
24 calculation and optimisation algorithms.

25

26 **Knowledge, skills and competences**

27 The Radiotherapy MPE has knowledge of:

- 28 ● Mould room activities,
29 ● Immobilisation devices, and their applications and accuracies,
30 ● Limitations and artefacts in the use of imaging modalities used in the radiotherapy simulation
31 process, and consequences for treatment uncertainties and quality,
32 ● Hardware and software components and networking of a TPS,
33 ● Algorithms and methods to (optimise and) calculate and evaluate the dose distribution for
34 proton, photon and electron beams,
35 ● Beam modelling in treatment planning systems,
36 ● Uncertainties in dose calculations,
37 ● Photon, proton and electron plans for all treatment sites,
38 ● Techniques to delineate organs at risk, including the use of AI, auto-segmentation and
39 deformable registration, and
40 ● Specification and reporting of dose distributions, target volumes and margins (GTV, CTV, PTV,
41 ITV), according to international recommendations.

42

43 The Radiotherapy MPE is able to:

- 44 ● Apply multimodality imaging data (MRI, PET) and image fusion for target volume delineation,
45 ● Incorporate implanted devices into the treatment plan, including consideration of the effects
46 of high (electron) density materials on the dose calculation,
47 ● Perform an independent check of the individual patient plan, using both pre-treatment
48 dosimetry and a secondary dose calculation system.

49

50 The Radiotherapy MPE is competent to:

- 1 ● Oversee the treatment planning process, and advise on its limitations and the consequences
- 2 of treatment choices,
- 3 ● Commission a treatment planning system, including the beam modelling,
- 4 ● Advise on optimising individual treatment plans,
- 5 ● Implement a new treatment planning technique, and
- 6 ● Take responsibility for the dosimetric quality of an individual treatment plan.
- 7

8 **Deliverables**

- 9 1. Participate in the multidisciplinary development of a new treatment planning technique,
- 10 focusing on clinical constraints, treatment efficiency and safety as well as dosimetric quality.
- 11 2. Analyse plans for plan quality and potential pitfalls in delivery.
- 12 3. Perform a treatment plan comparison for proton therapy.
- 13

14 **II.2.e.iii. External beam treatment delivery, verification and modification**

15 **Short description**

16 The Radiotherapy MPE is responsible for all procedures and techniques to verify the different aspects
17 of the treatment, including:

- 18 ● Patient positioning and target localisation with different image-guided radiotherapy (IGRT)
- 19 techniques and on-line or off-line correction or plan adaptation protocols,
- 20 ● Data transfer from the TPS to the treatment unit through the record and verify system, and
- 21 ● Dosimetric verification of the planned dose distribution.
- 22

23 **Knowledge, skills and competences**

24 The Radiotherapy MPE has knowledge of:

- 25 ● Patient alignment and set-up on the CT/MR and on the treatment unit,
- 26 ● (pre-treatment) Dosimetric verification of radiotherapy plans,
- 27 ● IGRT techniques on the treatment unit using MV, kV, CBCT and MRI images and surface
- 28 scanning to optimise the set-up and target localisation,
- 29 ● IGRT protocols (such as off-line or on-line imaging, adaptive radiotherapy, plan of the day,
- 30 and on-line replanning including the use of deformable image registration, dose
- 31 summation, and workflow possibilities),
- 32 ● Intra- and inter-fraction set-up errors and target motion,
- 33 ● Tolerances and action levels, and
- 34 ● Techniques to account for and minimise respiratory motion during pre-treatment imaging
- 35 and during treatment.
- 36

37 The Radiotherapy MPE is able to:

- 38 ● Calculate the treatment (PTV) margin to incorporate the patient setup accuracy,
- 39 ● Analyse and interpret setup images and the consequences of setup errors during patient
- 40 treatment, and
- 41 ● Analyse and interpret dosimetric verification measurements and judge the relevance for
- 42 patient treatment.
- 43

44 The Radiotherapy MPE is competent to:

- 45 ● Take responsibility for the continuation of the patient treatment at the treatment machine
- 46 in case of deviations from the planned situation.
- 47

48 **Deliverables**

- 49 1. Advise on used PTV margins or robust treatment planning procedure for a radiotherapy
- 50 treatment based on literature, measurements and calculations.

1 **II.2.e.iv. Brachytherapy**

2 **Short description**

3 Brachytherapy is a radiotherapy technique that uses sealed radioactive sources that are placed inside
4 or close to the tumour. The Radiotherapy MPE is responsible for the correct use of dosimetry protocols,
5 applicators, measurement systems and brachytherapy TPS.

6

7 **Knowledge, skills and competences**

8 The Radiotherapy MPE has knowledge of:

- 9 ● After loading systems and low-dose rate permanent seed implant systems,
- 10 ● The clinical application of imaging for brachytherapy,
- 11 ● The source calibration equipment, and relevant quality control procedures,
- 12 ● Treatment planning for various sites, including gynaecology and prostate,
- 13 ● The reconstruction of the brachytherapy needles on images and the influence of
14 uncertainties on the dose distribution, and
- 15 ● Basic radiation safety procedures, such as leakage tests on the sources, disposal of sources,
16 prevention of source loss and action in case of source loss.

17

18 The Radiotherapy MPE is competent to:

- 19 ● Take responsibility for the dosimetric accuracy of the treatment plan.

20

21 **Deliverables**

- 22 1. Be present during the preparation and treatment of one patient treated with 3D image-guided
23 brachytherapy (e.g., prostate, cervix), including presence at the operating room.
- 24 2. Be present at a source replacement by the company, perform a measurement of the source
25 activity and import this activity in the TPS.

26

27

1 **II.3. Risk Management, Quality Control and Safety in the** 2 **Medical Environment**

3 **II.3.a. Common Trunk**

4 **Short description**

5 Quality management requires an organisational structure (quality system) in which responsibilities,
6 procedures, processes and resources are clearly defined. The quality system must be compliant with
7 all the requirements of (inter)national legislation and accreditation and requires the development of a
8 formal quality assurance program that details the quality assurance policies and procedures.

9 The MPE assesses the impact of many (potential) radiological, electrical, chemical, mechanical and
10 biological hazards to patients and hospital staff and is responsible for the quality management of
11 medical equipment.

12 **Knowledge, skills and competences**

13 The MPE has knowledge of:

- 14 ● Principles of safety and risk management,
- 15 ● Electrical, electro-magnetic, MR, optical, acoustic and mechanical safety,
- 16 ● The safety management system (Dutch: Veiligheid Management System – VMS) in place
17 at the hospital,
- 18 ● National and international guidelines and regulations (such as the Dutch “Veilige
19 Toepassing van Medische Technologie in de medisch specialistische zorg” and the Medical
20 Device Regulation) [8, 9],
- 21 ● Quality management systems, records, audits and improvement in quality,
- 22 ● Different methods of investigation following an incident to analyse its causes and
23 consequences, and design changes to practice to avoid repetition, and
24 ● The life cycle of medical equipment.

25 The MPE is competent to:

- 26 ● Organise quality control and quality assurance programs.

27 **Deliverables**

- 28 1. Participate in a quality control program for a medical device or clinical procedure.
- 29 2. Participate in incident management, e.g., by analysing a recent incident or joining the
30 department incident management committee.
- 31 3. Perform a prospective or retrospective risk analysis for existing or new equipment or
32 treatment technique.

33 **II.3.b. General medical physics**

34 **Short description**

35 The General MPE is able to act as the key person on the safe use of medical technology in a hospital.

36 **Knowledge, Skills and Competences:**

37 The General MPE has knowledge of:

- 38 ● Electrical safety of rooms and safety classes,
- 39 ● Electrical safety of medical devices according to IEC 60601,
- 40 ● Maintenance protocols,
- 41 ● Cleaning, disinfection and sterilisation of medical devices,
- 42 ● Recall procedures,

- 1 ● Standards for quality procedures for medical devices (such as ISO 9001 and ISO 13485), and
- 2 ● Specific standards, procedures and protocols in the field of acceptance, and status testing
- 3 (such as reports from the IEC, AAPM, IPEM and QC Light and WAD protocols).

4

5 The General MPE is able to:

- 6 ● Establish a maintenance scheme,
- 7 ● Increase quality, and implement new technology and systems, and act on organisational
- 8 changes and dynamics,
- 9 ● Plan and overview the installation of a new medical device and communicate with the local
- 10 building manager and/or facility management and manufacturer or local representative,
- 11 ● Contribute to protocols to maintain or improve safe working conditions,
- 12 ● Assess, or contribute to the assessment of, the level of competence that is required to safely
- 13 operate medical devices,
- 14 ● Define quality measures for safe and effective uses of medical devices throughout the
- 15 hospital,
- 16 ● Conduct a patient-related incident analysis on different levels,
- 17 ● Contribute effectively to a multi-disciplinary risk analysis covering the physics aspects,
- 18 ● Perform audits to monitor compliance with national legislation and agreements on medical
- 19 technology, and
- 20 ● Assess changes in the national legislation on medical technology and its use and analyse the
- 21 implications for the hospital organisation and its quality management system.

22

23 Deliverables

- 24 1. (re)Write, implement or follow-up at least one local guideline on quality management or
- 25 closely related item,
- 26 2. Perform or participate in at least one audit or safety check of a department in which a lot of
- 27 medical equipment is used,
- 28 3. Participate in solving artefacts, and
- 29 4. Participate in image protocol optimisation for at least one type of radiological or nuclear
- 30 imaging equipment.

31 II.3.c. Audiology

32 Short description

33 The Audiology MPE is responsible for the care provided in the audiological centre, meaning that they
34 should be able to manage the care that is provided and take responsibility for ensuring that all
35 equipment complies with health and safety regulations, and that all healthcare professionals are well
36 trained. Furthermore, they need to monitor the quality and safety of equipment and of the care
37 patients receive. They should continuously monitor and improve quality and safety of both the
38 equipment and the content and organisation of the clinical care, and know how to handle incidents,
39 including how to analyse them and take appropriate action to prevent them from reoccurring in the
40 future (i.e. have knowledge of PDCA cycles).

41

42 Knowledge, skills and competences

43 The Audiology MPE has knowledge of:

- 44 ● NEN and ISO norms regarding audiology, and
- 45 ● The adverse effect of noise exposure on the auditory system.

46

47 The Audiology MPE is able to:

- 48 ● Advise and counsel patients about the possible adverse effects of noise exposure, with
- 49 particular consideration of work-related issues,

- 1 ● Take responsibility for patient safety, the appropriate use of equipment and the quality and
- 2 safety of the audiological care that is given,
- 3 ● Write, optimise and maintain rules of conduct, clinical operations or procedures of
- 4 audiological care, and
- 5 ● Safely manage patient information according to the relevant legislation.

6 **II.3.d. Radiology and Nuclear Medicine**

7 **Short description**

8 The imaging and therapeutic modalities that use x-ray, radionuclides, MRI and ultrasound are
9 categorised as high-risk medical equipment because of the potential direct physical risks (mechanical,
10 radiation, heating) for patients and employees and the risk of incorrect diagnosis in case of
11 malfunctions and artefacts. Therefore, it is important to implement and maintain a quality assurance
12 programme. The Radiology and Nuclear Medicine MPE plays a central role in the establishment and
13 implementation of a quality assurance programme as a specialist in this field.

14 **Knowledge, skills and competences**

15 The Radiology and Nuclear Medicine MPE has knowledge of:

- 16 ● The difference between quality protocols that test for the consistency (Dutch:
17 constantheidstesten) and in-depth quality protocols,
- 18 ● Optimisation of patient safety, quality and cost,
- 19 ● Calibration and use of equipment and phantoms,
- 20 ● General legislation in the field of quality, including Good Laboratory Practice (GLP), ISO
21 certification, the Quality Act, and the Nuclear Energy Act, and
- 22 ● Specific procedures and protocols in the field of acceptance, and status tests (such as reports
23 from the IEC, AAPM and IPEM and QC Light and WAD protocols).

24 The Radiology and Nuclear Medicine MPE is able to:

- 25 ● Establish a quality assurance programme for the whole imaging department,
- 26 ● Communicate with technicians, technologists and physicians on quality assurance and
27 maintenance, and supervise quality control testing,
- 28 ● Determine the clinical relevance of artefacts and surpassed quality criteria,
- 29 ● Apply and understand different metrics and parameters used for image quality evaluation,
30 such as homogeneity, contrast, detail, DQE, MTF, NPS, SNR, CNR, SSIM, DICE, and MAE,
- 31 ● Make a risk assessment based on the physical properties of the equipment used and the
32 quality programme in place,
- 33 ● Perform acceptance testing, commissioning and quality control of all the RNG imaging
34 equipment,
- 35 ● Advice on a safe MRI-room, including magnetic field containment and Faraday cage, and
36 ● To judge MR safety for patient contraindications and 3rd company devices.

37 The Radiology and Nuclear Medicine MPE is competent to:

- 38 ● Take appropriate measures based on risk assessment and the results of the quality
39 programme,
- 40 ● Perform PET quality testing and assure guidelines: procedure guidelines nuclear medicine
41 Dutch society of nuclear medicine, NEMA-NU2, NEMA-NU4, EARL-accreditation,
- 42 ● Perform SPECT quality testing and assure guidelines: procedure guidelines nuclear medicine
43 Dutch society of nuclear medicine, NEMA-NU1,
- 44 ● Setup quality control program for diagnostic displays,
- 45 ● Advice on safe MR scanning of patients with implants, and
- 46 ● Filling role of MR safety expert in the hospital.

1 **Deliverables**

- 2 1. Evaluate a radiological or nuclear imaging QC policy and give advice on addition/removal of
3 QC tests.
4 2. Perform a risk analysis for the introduction of an image guided intervention.
5 3. Handle individual cases of patients with implants who are referred for an MRI scan.
6

7 **II.3.e. Radiotherapy**

8 **Short description**

9 Risk management and quality control is one of the main responsibilities of the Radiotherapy MPE. The
10 MPE develops and oversees quality control programs for radiotherapy equipment and is responsible
11 for dosimetric quality assurance and the risk management for the complete radiotherapy dose delivery
12 chain.
13

14 **Knowledge, skills and competences**

15 The Radiotherapy MPE has knowledge of:

- 16 ● Quality control programs of radiotherapy treatment devices, and
17 ● Incident and near incident management systems.
18

19 The Radiotherapy MPE is able to:

- 20 ● Analyse incidents and near incidents,
21 ● Perform patient dose measurements, and
22 ● Perform quality control measurements.
23

24 The Radiotherapy MPE is competent to:

- 25 ● Take responsibility for the quality assurance of medical equipment at the radiotherapy
26 department, and
27 ● Decide about clinical use of equipment after preventive or corrective maintenance.
28
29

1 **II.4. Radiation Physics, (Radiation) Protection and Dosimetry**

2 **II.4.a. Common Trunk**

3 **Short description**

4 The MPE often plays a key role in radiation protection and dosimetry, ensuring the radiation safety of
5 patients. These MPE's know the biological effects of radiation for exposed individuals, the relevant
6 regulations, methods of compliance and record keeping, and are qualified to assess the radiation risk,
7 optimise medical exposures, and apply the ALARA and dose limitation principles in the design of
8 radiation therapy facilities, treatment protocols and imaging protocols.

9 In some cases, the MPE has the role of the Radiation Protection Expert (Dutch: Coördinerend
10 Deskundige) and is also responsible for ensuring the radiation safety of hospital staff and the general
11 public. These MPE's are also responsible for the application of legal regulations (such as licences for
12 the department).

13

14 **Knowledge, skills and competences**

15 The MPE has knowledge of:

- 16 ● Radiation protection, ionising radiation and non-ionising radiation (such as microwave, RF and
17 magnetic fields, ultraviolet and laser light, and ultrasound),
- 18 ● Generation and physical interactions of ionising radiation,
- 19 ● Biological effects of different types of radiation on various tissues,
- 20 ● Principles of radiation safety procedures, and
- 21 ● The physics and techniques of radiation detection systems.

22

23 The MPE is able to:

- 24 ● Optimise medical exposure to radiation,
- 25 ● Select equipment required to perform radiation protection measurements,
- 26 ● Optimise radiation protection of patients and other individuals exposed to medical radiation,
27 including the determination and use of diagnostic reference levels,
- 28 ● Estimate measurement uncertainties, counting statistics and detection limits,
- 29 ● Apply principles of patient dosimetry with radiological x-ray sources,
- 30 ● Implement the local regulations of radiation protection,
- 31 ● Apply the relevant (inter)national guidelines, and
- 32 ● Implement diagnostic reference levels (DRLs).

33

34 The MPE is competent to:

- 35 ● Train practitioners and other staff in relevant aspects of radiation protection,
- 36 ● Advise a practitioner or patient after an incident related to ionising radiation, and
- 37 ● Advise a physician or patient about the risks of exposure to ionising radiation.

38

39 **Deliverables**

- 40 1. The relevant national course for radiation protection expert (Coördinerend deskundige (AKF,
41 RNG, RTH) or Toezichthoudend Medewerker Stralingsbescherming – Medische Toepassingen
42 (AUD)) should be successfully completed.
- 43 2. At least one of the following items:
 - 44 a. Perform a radiation survey of an area using appropriate dose-rate equipment,
 - 45 b. Study or perform practical design calculations for a room in which ionising radiation
46 will be used,
 - 47 c. Plan and practice contingency measures, such as for a lost radiation source or spill,
 - 48 d. Discuss decontamination procedures after a spill of liquid radionuclide with
49 practitioners or patients,

- 1 e. Join the local Radiation Protection Commission of your department or institute,
- 2 f. Join the local medical ethics committee as an advisor on the use of ionising radiation
- 3 in human research, or
- 4 g. Compose or assist in composing a permit application for radiation protection (Dutch
- 5 Vergunningsaanvraag ANVS).
- 6

7 **II.4.b. General medical physics**

8 **Short description**

9 The General MPE should be an authority on dosimetry of personnel, the risks of radiation, and the
10 relevant guidelines. The General MPE should be able to function as a radiation protection expert
11 (Dutch: *Coördinerend deskundige*) of a general hospital.

12

13 **Knowledge, Skills and Competences**

14 The General MPE is able to:

- 15 ● Interact with the Labour Inspection (Dutch: Arbeidsinspectie) and the radiation protection
- 16 authority (Dutch: Autoriteit Nucleaire Veiligheid en Stralingsbescherming – ANVS) regarding
- 17 compliance to the regulations under the Nuclear Energy Act (Dutch: Kernenergiewet),
- 18 ● Manage the Nuclear Energy/radiation protection regulations (Dutch: Kernenergiewet dossier)
- 19 of a hospital,
- 20 ● Calculate radiation protection requirements in facilities that use ionising radiation,
- 21 ● Demonstrate a good understanding of the fundamental theoretical and practical aspects of
- 22 dosimetry,
- 23 ● Calculate the patient dose after unintended exposure of a patient to ionising radiation from
- 24 medical radiological equipment,
- 25 ● Estimate the foetal dose from an unintended exposure of a pregnant patient to ionising
- 26 radiation from medical radiological equipment,
- 27 ● Provide travel advice to a patient receiving nuclear medicine therapy, and
- 28 ● Understand the role the MPE plays when a pregnant patient requires a radiologic exam at the
- 29 Radiology or Nuclear Medicine department and provide advice to clinicians.

30 **II.4.c. Audiology**

31 No additional (KSC) requirements to common trunk.

32 **II.4.d. Radiology and Nuclear Medicine**

33 **Short description**

34 The Radiology and Nuclear Medicine MPE should be an authority on dosimetry of personnel, the risks
35 of radiation and the relevant guidelines. The MPE should be capable of selecting and using the different
36 measurement systems and software tools for dosimetry and quality control. This includes acceptance
37 testing, calibration and quality control of these measurement systems as well as estimation of the
38 (statistical) uncertainty of measurements.

39 Note: The topic of patient dosimetry is specified in detail in chapter 3 of the Radiology and Nuclear
40 Medicine curriculum.

41

42 **Knowledge, skills and competences**

43 The Radiology and Nuclear Medicine MPE is competent to:

- 44 ● Determine appropriate treatment activity and calculate radiation dose for patients pre- and
- 45 post-treatment,
- 46 ● Implement a new therapeutic or diagnostic application (such as a dosimetry method or safety
- 47 protocols),

- 1 • Demonstrate a good understanding of the fundamental theoretical and practical aspects of
- 2 dosimetry,
- 3 • Apply principles of patient internal dosimetry with radioactive tracers (MIRD),
- 4 • Apply principles of dosimetry for personnel,
- 5 • Use software tools to calculate patient dose for both external x-ray sources and internal and
- 6 external radioactive tracers, and
- 7 • Take responsibility for absolute and relative dosimetry in the radiology and nuclear medicine
- 8 department.

9

10 **Deliverables**

- 11 1. Perform dosimetry calculations for radionuclide therapy.
- 12 2. Perform dosimetry calculations for radiological and radionuclide imaging.
- 13 3. Independently fill a QC phantom with radionuclides, perform the decontamination procedures
- 14 after a spill of liquid radionuclide.

15 **II.4.e. Radiotherapy**

16 **Short description**

17 Accurate dose assessment is an essential task of the radiotherapy medical physics group. The
18 Radiotherapy MPE is responsible for the delivered dose and the correct use of dosimetry devices and
19 protocols. The Radiotherapy MPE oversees the calibration chain from the national primary standard
20 to the hospital field instruments and understands the physics, techniques, and clinical use of the
21 different dosimetry detectors involved. Determination of the absolute absorbed dose for a clinical
22 beam under reference conditions by applying the (inter)national dosimetry protocol is a key
23 responsibility. The Radiotherapy MPE comprehends the methods for determination of dose in non-
24 reference conditions.

25

26 **Knowledge, skills and competences**

27 The Radiotherapy MPE has knowledge of:

- 28 • Interaction of photons, protons, and electrons in matter,
- 29 • Fundamentals of absorbed dose and KERMA,
- 30 • Fundamentals of reference dosimetry for megavoltage photon and electron beams and for
- 31 brachytherapy sources and proton beams,
- 32 • National (NCS) and international codes of practice for the determination of absorbed dose to
- 33 water, and
- 34 • Dosimetric and measurement uncertainties through the complete dose delivery chain.

35

36 The Radiotherapy MPE is able to:

- 37 • Perform absorbed dose measurements in clinical situations,
- 38 • Select the most appropriate detector for measurement of absolute dose and relative dose
- 39 distributions under different irradiation conditions,
- 40 • Set up a program for acceptance testing, calibration and quality control of the measurement
- 41 systems,
- 42 • Calibrate ionisation chambers, and
- 43 • Acquire beam data for the treatment planning system.

44

45 The Radiotherapy MPE is competent to:

- 46 • Take responsibility for the absolute and relative dosimetry in the radiotherapy department.

47

48 **Deliverables**

- 49 1. Participate in an external dosimetry audit.

1 II.5. IT and data science

2 II.5.a. Common Trunk

3 Short description

4 The MPE understands the role and importance of Information Technology (IT) in the clinical field. The
5 MPE knows the main systems for information sharing, storage, and retrieval in a hospital and of the
6 formats for medical data. The MPE advises on the use of medical equipment within the hospital IT
7 system, on the use of applications such as a Patient Data Monitoring System (PDMS) or the Picture
8 Archiving and Communication Systems (PACS), on an electronic patient record (EPR), or on the use of
9 a patient monitoring system.

10 Knowledge of general IT-security regulations for collection, storage and transmission and data
11 protection legislation, such as the General Data Protection Regulation (Dutch: Algemene verordening
12 gegevensbescherming – AVG) is mandatory, as well as an understanding of the role and responsibilities
13 of the Chief (Medical) Information Officer (CIO and CMIO) of the institute.

14
15 The MPE has knowledge of data processing, Big Data handling and Artificial Intelligence (AI), and the
16 methods applied in commercial or in-house developed products, in order to be able to be responsible
17 for the safe and optimal use of these products and to set up quality control programmes. In his or her
18 work the MPE relates to management of information, (data) networks and systems.

19 20 Knowledge, skills and competences

21 The MPE has knowledge of:

- 22 ● PACS, the hospital information system, PDMS, standards in medical data such as IHE, DICOM
23 and HL7, ICT security standards for collection, storage, transmission and protection of data,
- 24 ● Data safety (e.g., protected sub-nets),
- 25 ● The basics and applications of Big Data analyses and artificial intelligence (including Deep
26 Learning),
- 27 ● Electronic Health Record systems, and
- 28 ● Privacy procedures.

29
30 The MPE is able to:

- 31 ● Use basic programming skills,
- 32 ● Establish and operate a quality control programme for the safe use of medical software,
- 33 ● Establish the implementation of a medical device within the hospital IT system, and
- 34 ● Test and accept software that is part of or connected to a medical device.

35

36 II.5.b. General Medical Physics

37 Short description

38 Digital communication, storage and distribution is increasingly relevant to the General MPE. Images
39 and data need to be transferred stored and accessed, but also connected with the patient's electronic
40 health record (the Electronic Patient Dossier - EPD).

41

42 Knowledge, skills and competences:

43 The General MPE has knowledge of:

- 44 ● The digitization process, workflow and storage throughout the hospital,
- 45 ● Data-compression techniques and their potential effects on image degradation,
- 46 ● Specific application of machine learning on image reconstruction, processing and analysis, and
- 47 ● Software validation dedicated workstations, server-client, different combinations of
48 modalities and processing software.

1 The MPE is able to:

- 2 ● Write programs or scripts to handle data and to process and analyse images and DICOM
3 headers.

4

5 **Deliverables**

- 6 1. Perform an acceptance test/commissioning/calibration of medical software (such as AI).
7 2. Participate in an ICT project, e.g., PACS, VNA, etc.

8 **II.5.c. Audiology**

9 **Short description**

10 In audiology, data must be accumulated from various diagnostic devices and integrated within the
11 electronic patient file. The Audiology MPE is ultimately responsible for all (diagnostic) audiological data
12 and the safe and secure representation of the data within the (electronic) patient file.

13

14 **Knowledge, skills and competences:**

15 The Audiology MPE is able to:

- 16 ● Design of and advise on a safe representation of audiological data in the electronic patient
17 files.

18 **II.5.d. Radiology and Nuclear Medicine**

19 **Short description**

20 Digital image communication, storage and distribution are increasingly relevant for the MPE. Images
21 need to be transferred stored and accessed, but also connected with a patient's individual electronic
22 health record (the Electronic Patient Dossier - EPD).

23

24 **Knowledge, skills and competences:**

25 The Radiology and Nuclear Medicine MPE has knowledge of:

- 26 ● Data-compression techniques (lossless and lossy) and their potential image degradation
27 effects, and
28 ● Structured versus non-structured data in reporting results.

29

30 The Radiology and Nuclear Medicine MPE is able to:

- 31 ● Write programs or scripts to handle data and to process and analyse images and DICOM
32 headers, and
33 ● Perform software validation: dedicated workstations, server-client, different combinations of
34 modalities and processing software.

35

36 The Radiology and Nuclear Medicine MPE is competent to:

- 37 ● Establish hospital-wide policies for image storage and routing.

38

39

40 **Deliverables**

- 41 1. Perform an ICT project in the area of RNM (e.g. PACS, Portals, VNA, transmural image
42 exchange).

43 **II.5.e. Radiotherapy**

44 **Short description**

45 In a Radiotherapy department, a large amount of data is generated that must be rapidly available
46 during and after treatment.

47

1 **Knowledge, skills and competences:**

2 The Radiotherapy MPE has knowledge of:

- 3 ● The DICOM RTH standard,
4 ● Dedicated IT systems for Radiotherapy (such as systems for RTH logistics and Record and Verify
5 systems),
6 ● Backup solutions for dedicated Radiotherapy IT,
7 ● The role of AI in image generation, image reconstruction and image interpretation,
8 ● The role of AI in image segmentation and treatment planning, and
9 ● The role of AI in treatment (outcome) prediction.

10

11 The Radiotherapy MPE is able to:

- 12 ● Write programs or scripts to handle data and to process and analyse images and DICOM
13 headers.

14

1 **II.6. Organisation, management, finance, laws and ethics in** 2 **healthcare**

3 **II.6.a. Common Trunk**

4 **Short description**

5 The basic principles of healthcare finance, laws and medical ethics are an important framework for
6 acting in a clinical setting. The MPE negotiates financial matters with the hospital directors, and health
7 care insurance companies, and discusses ethical dilemmas.

8 9 **Knowledge, skills and competences**

10 The MPE has knowledge of:

- 11 ● The structure of the national healthcare system,
- 12 ● Financial aspects of the healthcare system, and health insurance,
- 13 ● Hospital management,
- 14 ● Departmental and/or hospital-wide financial plans,
- 15 ● Purchasing policy and European tenders,
- 16 ● Privacy legislation,
- 17 ● National healthcare legislations (e.g., WGBO, WMO, Wet Medische Hulpmiddelen, wet BIG),
- 18 ● Intellectual property regulations,
- 19 ● Ethical considerations in medical research, and
- 20 ● Medical Ethics Committees.

21
22 The MPE is able to:

- 23 ● Prepare a business case for purchase of new equipment including the total cost of ownership,
24 and
- 25 ● Work as part of a team to purchase and install new equipment.

26

27 **II.6.b. General Medical Physics**

28 No additional (KSC) requirements to common trunk.

29

30 **Deliverables**

- 31 1. Participate in the investment advisory process of the department or institute,
- 32 2. Participate in the procurement process (including procurement, installation, testing and
33 implementation) of a new medical device or medical software as part of a multidisciplinary
34 team.
- 35 3. For at least three medical devices, at the departments RadNG, OR/ICU, and Functional
36 Monitoring (e.g. Cardiology or Audiology) a General Medical Physics resident should:
 - 37 a. Advise during a complete business case, cost-benefit-analysis, request for proposal,
 - 38 b. Provide training to physicians, nurses or technicians for at least one type of medical
39 equipment.

40 **II.6.c. Audiology**

41 **Short description**

42 In the Dutch healthcare system, the Audiology MPE is ultimately responsible for the audiological care
43 provided to patients. It is the MPE's responsibility that the care the centre provides is in accordance
44 with rules, regulations and guidelines. To this end they should understand various aspects of the
45 national healthcare system and how audiological care is financed, be able to consider ethical aspects
46 and have excellent communication skills.

1 **Knowledge, skills and competences**

2 The Audiology MPE has knowledge of:

- 3 ● The relevant guidelines of the NVKF, FENAC and KNMG,
4 ● The NOAH protocol,
5 ● The restitution policy of insurance companies, and
6 ● Finance of audiological healthcare.
7

8 The Audiology MPE is able to:

- 9 ● Take responsibility for the management and content of the care that is provided, which should
10 be in accordance with the latest developments and with consideration for the financial
11 aspects, and
12 ● Maintain professional relationships with relevant care partners (such as hearing -aid dispensers
13 and health care companies).

14 **II.6.d. Radiology and Nuclear Medicine**

15 **Knowledge, skills and competences**

16 The Radiology and Nuclear Medicine MPE is able to:

- 17 ● Advise on preparation of a tender,
18 ● Write a request for proposal for purchasing a new imaging device,
19 ● Specify, justify and rank the criteria for selecting new imaging devices, and
20 ● Negotiate with vendors.
21

22 **Deliverables**

- 23 1. Participate in the investment advisory process of the department or institute,
24 2. Participate in the procurement process (including procurement, installation, testing and
25 implementation) of a new medical device or medical software as part of a multidisciplinary
26 team.

27 **II.6.e. Radiotherapy**

28 No additional (KSC) requirements to common trunk.
29

30 **Deliverables**

- 31 1. Participate in the investment advisory process of the department or institute,
32 2. Participate in the procurement process (including procurement, installation, testing and
33 implementation) of a new medical device or medical software as part of a multidisciplinary
34 team.
35

1 **II.7. Science and Innovation**

2 **Short description**

3 The MPE plays a central role in science and innovation in medical technology. The MPE is responsible
4 for initiating innovations as well as performing and initiating scientific research. The MPE translates
5 clinical problems into scientific questions and translates scientific results into clinical innovations. The
6 MPE can critically and objectively evaluate published research results. To prepare the MPE for these
7 tasks, a research project is undertaken during the training program, either as a full-time activity within
8 a well-defined period or on part-time basis over a prolonged time period (e.g., part of the practical
9 training period).

10 Research should be well structured, well defined and clinically relevant. Research should be performed
11 under supervision of an experienced scientist, preferably in a multidisciplinary research group with
12 regular research meetings and group presentations, in order to expose the resident to other research
13 methods and topics.

14 Research should be carefully planned to identify a specific research topic and formulate a clear
15 research question in the first year of the training. Essential steps such as approval of the Institutional
16 Review Board, access to clinical data and availability of equipment should be met in the second year
17 of the training. It is recommended that at the end of year three a scientific report is ready for peer
18 review. Regular reporting of the progress of the research project(s) in the progress report is advised.

19 Note: many institutes have certain requirements when performing research (e.g. BROK, GCP).

21 **Knowledge, skills and competences**

22 The MPE has knowledge of:

- 23 ● Ethical and privacy regulations for scientific research,
- 24 ● Fundamentals of biostatistics and statistical tests,
- 25 ● Computational techniques and software packages for statistical data analysis,
- 26 ● Meta-analysis and medical big data studies, and
- 27 ● Regulations on intellectual property.

28
29 The MPE is able to:

- 30 ● Design a clinical or technical study to improve diagnostic and treatment techniques,
- 31 ● Write an application for approval by the medical ethical committee,
- 32 ● Review scientific literature,
- 33 ● Design an experiment and collect data,
- 34 ● Analyse and interpret experimental results,
- 35 ● Evaluate the impact of innovative diagnostic and treatment techniques,
- 36 ● Perform or analyse studies of patient outcomes (such as survival data, complication rates or
37 patient reported outcomes),
- 38 ● Present results from scientific research, and
- 39 ● Report scientific results.

40
41 The MPE is competent in:

- 42 ● Translating scientific results into clinical innovations, and
- 43 ● Translating clinical problems into scientific questions.

45 **Deliverables**

- 46 1. Peer-reviewed paper as a first author or an oral presentation at an International Congress
47 (with peer-reviewed abstract submission) as presenter. This is required by law, Staatsbesluit
48 [6]. Also refer to “Praktische uitwerking van de eis tot wetenschappelijke vorming binnen de
49 opleiding tot klinisch fysicus” on www.stichtingokf.nl
- 50 2. Attend at least one international scientific conference, e.g. ESTRO, ECMP, ASTRO, AAPM, HPA,
51 EANM, RSNA, ECR, ISMRM, EFAS.

1 **III. CanMEDS-roles**

2 **III.1. Medical Physics Expert**

3 'Medical Physics Expert' is the central role and integrates the other six roles. An excellent knowledge
4 of the specific medical physics field, as well as an excellent knowledge of all basic and state-of-the-art
5 techniques, including their (dis)advantages, are part of this role. Furthermore, the MPE has a broad
6 knowledge about physiology and pathology and up-to-date diagnostic, therapeutic and rehabilitation
7 skills to enable the MPE to collect and interpret relevant data.

8
9 The MPE must demonstrate and apply knowledge in clinical practice through skills and appropriate
10 attitude. At the end of the residency the MPE should be able to:

- 11 ● Apply physics and medical standards in their department,
- 12 ● Take responsibility for quality management of medical technology,
- 13 ● Take responsibility for innovation and clinical implementation of (new) medical technology for
14 patient treatment or diagnostics, and
- 15 ● Advise on, contribute to, and take responsibility for the quality of the diagnosis or treatment
16 of an individual patient.

17 In some cases the MPE is responsible for diagnosis and treatment of patients. In this case the MPE is
18 capable of diagnosing the relevant pathology and initiating evidence-based treatment, and takes full
19 responsibility for diagnosis and follow-up.

20 **III.2. Collaborator**

21 In order to secure the best possible healthcare for the patients, the MPE is able to work in a multi-
22 disciplinary team that includes physicians, medical physicists, paramedical staff, computer scientists,
23 medical engineers, clinical technologists and administrators. This multi-disciplinary approach extends
24 to collaboration with researchers, management of the institute, other healthcare professionals and
25 representatives of the industry. Therefore, the MPE is able to participate in organising and structuring
26 the clinical process and associated tasks and responsibilities. Moreover, the ability to collaborate
27 constructively also relies on a sound understanding of one's own role within the clinical team and the
28 necessary interactions with individuals and healthcare professional teams.

29 **III.3. Communicator**

30 The MPE is able to communicate in an effective, appropriate and unambiguous manner, with patients
31 and healthcare professionals, to ensure the safe and accurate provision of healthcare services. These
32 communication skills include communication of accurate scientific and non-scientific information, in
33 both oral and written form, within the department, and with other departments and/or staff,
34 colleagues, vendors, other professionals in the industry and the general public.

35 The MPE, especially when treating patients,

- 36 ● Maintains relations with the patient and discusses the outcomes of diagnostic data and
37 treatment options,
- 38 ● Is able to give information to the patient (and their carer),
- 39 ● Is able to give information to professionals and answer their questions, and
- 40 ● Is able to use non-scientific language whilst ensuring clear and understandable information is
41 given,
- 42 ● Is able to communicate Dutch on a B2 level of the Common European Framework of Reference
43 for Languages, in agreement with the level required for BIG registration
44 (www.bigregister.nl). When a candidate's level Dutch is questioned before starting a
45 residency the candidate may be asked to test their Dutch fluency.

1 <https://www.bigregister.nl/buitenlands-diploma/procedures/verklaring->
2 [vakbekwaamheid/nederlandse-taalvaardigheid](https://www.bigregister.nl/buitenlands-diploma/procedures/verklaring-vakbekwaamheid/nederlandse-taalvaardigheid)

3 **III.4. Health Advocate**

4 The MPE acts as a Health Advocate to positively influence the healthcare and healthcare organisations
5 for patients and society. The MPE should:

- 6 ● Understand, and be able to act within, relevant national legal frameworks, regulations and
7 guidelines,
- 8 ● Be able to act according to the best use of resources in the interest of the patient and society,
- 9 ● Be able to take adequate action (within their own competency limitations) in response to
10 incidents/accidents,
- 11 ● Show consideration for the ethical, religious, cultural and moral values of others,
- 12 ● Demonstrate knowledge of ethical considerations in medical practice, and
- 13 ● Know the relevant national and European healthcare legislation and guidelines and act
14 accordingly.

15 **III.5. Leader**

16 The MPE:

- 17 ● Manages and coordinates projects in an interdisciplinary team, both at the level of the
18 department and at institute level,
- 19 ● Advises staff and directors concerning routine medical physics services, the strategic policy of
20 the specific department, and new developments, and
- 21 ● Is able to relate department affairs (such as personnel, investments and finance) to the
22 organisation of the institute and the organisation of healthcare in general.

23 In some cases the MPE is responsible for diagnosis and treatment of patients. In this case the MPE is
24 able to manage patient flows and waiting lists.

25 **III.6. Professional**

26 The MPE has a high standard of professionalism and integrity, self-awareness and awareness of
27 limitations of knowledge and competences, as well as high standards of ethical and moral behaviour,
28 reliability and responsibility, respect for patient dignity, and autonomy.

29 The MPE

- 30 ● Acts in accordance with medical ethical values in order to address dilemmas in the clinical
31 environment,
- 32 ● Knows the relevant laws for health care. Patient treatment and diagnosis is preferably
33 evidence-based.
- 34 ● Organises and performs safety and risk management, registers incidents systematically, and
35 initiates corrective actions.

37 **III.7. Scholar**

38 The field of medicine and medical physics is a dynamic, quickly evolving discipline. The MPE:

- 39 ● Is able to develop, perform, and supervise research and innovation, and publish and present
40 the research data,
- 41 ● Is responsible for the introduction and implementation of new advanced diagnostic and
42 treatment technologies along with optimisation of existing techniques,
- 43 ● Should have a good national and international network and broad scientific interests, and
44 endeavour to constantly learn and acquire new knowledge, and
- 45 ● Is able to teach and train residents as well as other professionals in his or her field of expertise.

1 V. Appendices

2 V.1. Deliverables

3 V.1.a. Common Trunk

4 2. Physics and Engineering in Medicine

- 5 1. Write a recommendation for development/adjustment of a medical device or procedure that
6 is in clinical use.

8 3. Risk Management, Quality Control and Safety in the Medical Environment

- 9 1. Participate in a quality control program for a medical device or clinical procedure.
- 10 2. Participate in incident management, e.g., by analysing a recent incident or joining the
11 department incident management committee.
- 12 3. Perform a prospective or retrospective risk analysis for existing or new equipment or
13 treatment technique.

14

15 4. Radiation Physics, (Radiation) Protection and Dosimetry

- 16 1. The relevant national course for radiation protection expert (Coördinerend deskundige (AKF,
17 RNG, RTH) or Toezichthoudend Medewerker Stralingsbescherming – Medische Toepassingen
18 (AUD)) should be successfully completed.
- 19 2. At least one of the following items:
 - 20 a. Perform a radiation survey of an area using appropriate dose-rate equipment,
 - 21 b. Study or perform practical design calculations for a room in which ionising radiation
22 will be used,
 - 23 c. Plan and practice contingency measures, such as for a lost radiation source or spill,
 - 24 d. Discuss decontamination procedures after a spill of liquid radionuclide with
25 practitioners or patients,
 - 26 e. Join the local Radiation Protection Commission of your department or institute,
 - 27 f. Join the local medical ethics committee as an advisor on the use of ionising radiation
28 in human research, or
 - 29 g. Compose or assist in composing a permit application for radiation protection (Dutch
30 Vergunningsaanvraag ANVS).

31

32 7. Science and Innovation

- 33 1. Peer-reviewed paper as a first author or an oral presentation at an International Congress
34 (with peer-reviewed abstract submission) as presenter. This is required by law, Staatsbesluit
35 [6]. Also refer to “Praktische uitwerking van de eis tot wetenschappelijke vorming binnen de
36 opleiding tot klinisch fysicus” on www.stichtingokf.nl
- 37 2. Attend at least one international scientific conference, e.g. ESTRO, ECMP, ASTRO, AAPM, HPA,
38 EANM, RSNA, ECR, ISMRM, EFAS.

39

40

1 **V.1.b. General Medical Physics**

2 **2. Physics and Engineering in Medicine**

- 3 1. Independently perform or participate in acceptance tests/commissioning/calibration for at
4 least 3 medical devices, at least at the following locations: Radiology/Nuclear Medicine,
5 OR/ICU, and Functional Monitoring (e.g. Cardiology or Audiology).
6 2. Advise in the building/room design requirements, determine electrical safety requirements
7 and perform acceptance tests for medical rooms, specifically concerning Ionising and
8 Electromagnetic radiation protection.

9
10 **3. Risk Management, Quality Control and Safety in the Medical Environment**

- 11 1. (re)Write, implement or follow-up at least one local guideline on quality management or
12 closely related item,
13 2. Perform or participate in at least one audit or safety check of a department in which a lot of
14 medical equipment is used,
15 3. Participate in solving artefacts, and
16 4. Participate in image protocol optimisation for at least one type of radiological or nuclear
17 imaging equipment.

18
19 **5. IT and data science**

- 20 1. Perform an acceptance test/commissioning/calibration of medical software (such as AI).
21 2. Participate in an ICT project, e.g., PACS, VNA, etc.

22
23 **6. Organisation, management, finance, laws and ethics in healthcare**

- 24 1. Participate in the investment advisory process of the department or institute,
25 2. Participate in the procurement process (including procurement, installation, testing and
26 implementation) of a new medical device or medical software as part of a multidisciplinary
27 team.
28 3. For at least three medical devices, at the departments RadNG, OR/ICU, and Functional
29 Monitoring (e.g. Cardiology or Audiology) a General Medical Physics resident should:
30 a. Advise during a complete business case, cost-benefit-analysis, request for proposal,
31 b. Provide training to physicians, nurses or technicians for at least one type of medical
32 equipment.

33
34
35
36
37 **V.1.c. Audiology**

38 **2. Physics and Engineering in Medicine**

- 39 1. Independently perform or participate in acceptance tests/commissioning/calibration of an
40 audiometer and deliver a calibration report.
41 2. Perform or participate in an acceptance test of a sound booth/audiometry room.

42

1 **V.1.d. Radiology and Nuclear Medicine**

2 **2. Physics and Engineering in Medicine**

- 3 1. Independently perform or participate in acceptance tests/commissioning/calibration for
4 each of the five large modalities (SPECT/PET/Fluoroscopy/MRI/CT).
5 2. Perform protocol optimization on a radiological or nuclear imaging modality.
6 3. Guide the introduction of a software application in the field of RNM (such as AI tool for
7 reconstruction, images analysis project).
8 4. Deliver education to medical disciplines on image techniques.
9 5. Advise in the building/room design requirements, determine electrical safety
10 requirements and perform acceptance tests for medical rooms, specifically concerning
11 Ionising and Electromagnetic radiation protection.
12

13 **3. Risk Management, Quality Control and Safety in the Medical Environment**

- 14 1. Evaluate a radiological or nuclear imaging QC policy and give advice on addition/removal of
15 QC tests.
16 2. Perform a risk analysis for the introduction of an image guided intervention.
17 3. Handle individual cases of patients with implants who are referred for an MRI scan.
18

19 **4. Radiation Physics, (Radiation) Protection and Dosimetry**

- 20 1. Perform dosimetry calculations for radionuclide therapy,
21 2. Perform dosimetry calculations for radiological and radionuclide imaging,
22 3. Independently fill a QC phantom with radionuclides, perform the decontamination procedures
23 after a spill of liquid radionuclide.
24

25 **5. IT and data science**

- 26 1. Perform an ICT project in the area of RNM (e.g. PACS, Portals, VNA, transmural image
27 exchange).
28

29 **6. Organisation, management, finance, laws and ethics in healthcare**

- 30 1. Participate in the investment advisory process of the department or institute
31 2. Participate in the procurement process (including procurement, installation, testing and
32 implementation) of a new medical device or medical software as part of a multidisciplinary
33 team.
34
35

1 **V.1.e. Radiotherapy**

2 **1. The patient: Fundamentals of Human Anatomy, Physiology, Psychophysics, Pathology, and**
3 **Interacting with Patient**

- 4 1. Follow the treatment chain for curative treatment from multidisciplinary tumour board to first
5 treatment fraction for one patient.

6

7 **2. Physics and Engineering in Medicine**

8 **i. Treatment equipment for external radiotherapy**

- 9 1. Perform acceptance testing and commissioning of a treatment unit, treatment planning
10 system or imaging modality (MRI, CT) that is used for radiotherapy simulation.

11

12 **2. Physics and Engineering in Medicine**

13 **ii. Treatment simulation and planning**

- 14 1. Participate in the multidisciplinary development of a new treatment planning technique,
15 focusing on clinical constraints, treatment efficiency and safety as well as dosimetric quality.
16 2. Analyse plans for plan quality and potential pitfalls in delivery.
17 3. Perform a treatment plan comparison for proton therapy.

18

19 **2. Physics and Engineering in Medicine**

20 **iii. External beam treatment delivery, verification and modification**

- 21 1. Advise on used PTV margins or robust treatment planning procedure for a radiotherapy
22 treatment based on literature, measurements and calculations.

23

24 **2. Physics and Engineering in Medicine**

25 **iv. Brachytherapy**

- 26 1. Be present during the preparation and treatment of one patient treated with 3D image-guided
27 brachytherapy (e.g., prostate, cervix), including presence at the operating room.
28 2. Be present at a source replacement by the company, perform a measurement of the source
29 activity and import this activity in the TPS.

30

31 **4. Radiation Physics, (Radiation) Protection and Dosimetry**

- 32 1. Participate in an external dosimetry audit.

33

34 **6. Organisation, management, finance, laws and ethics in healthcare**

- 35 1. Participate in the investment advisory process of the department or institute
36 2. Participate in the procurement process (including procurement, installation, testing and
37 implementation) of a new medical device or medical software as part of a multidisciplinary
38 team.

42

43

44

45

46

1 V.2. EPA's

2 Beschrijving keuze en verantwoording leerdoelen

3 Van de huidige beroepsbeoefenaar wordt verwacht dat zij niet alleen vakbekwaam is, maar ook dat zij op haar handelen kan reflecteren en
4 haar handelen kan verantwoorden. Ook moet zij in onvoorziene omstandigheden adequaat kunnen handelen en zij moet er op gericht zijn
5 haar handelen continue te verbeteren. De beroepsbeoefenaar moet dus niet alleen vakbekwaam kunnen handelen, maar ook
6 beroepsbekwaam zijn. Dit betekent dat kennis, vaardigheden en beroepshouding een integraal en samenhangend onderdeel zijn van
7 beroepsmatig handelen.

8 Om hier passend en aansluitend bij en nascholing bij aan te bieden bij deze (beroeps)bekwaamheden moeten deze vertaald worden naar
9 leerdoelen.

10 *Een leerdoel beschrijft een streefsituatie met betrekking tot het verwerven van kennis en vaardigheden.*

11 Leerdoelen zijn belangrijk omdat leerdoelen sturing geven aan het leerproces. Daarbij voorzien leerdoelen als basis voor de inhoudelijke
12 invulling van een leermiddel.

13 Om op een juiste manier de beroepsbekwaamheden te vertalen naar leerdoelen maakt Noordhoff Health gebruik van twee taxonomische
14 instrumenten die complementair aan elkaar zijn; de prestatiematrix en de Taxonomie van Bloom.

15 Dit onderdeel gaat in op de deze twee verschillende taxonomieën en vertaalt dit naar een concreet voorbeeld.

16

17 Prestatiematrix beroepsbekwaam handelen

18 De prestatiematrix beroepsbekwaam handelen is een instrument om beroepskwalificaties te specificeren in leerdoelen of beroeps eisen.

19 De prestatiematrix is samengesteld vanuit de gedachte dat beroepsbekwaam handelen integraal handelen is (hoofd, handen en hart). Iedere
20 beroepsbekwaamheid wordt als zodanig geanalyseerd en beschreven in onderliggende leerdoelen, waarbij ook de beroepshouding deel
21 uitmaakt van de leerdoelen.

22 De prestatiematrix is opgebouwd uit de drie handelingscategorieën in combinatie met drie bekwaamheidsniveaus.

23

24

1 *Handelingscategorieën*

2 Over het algemeen worden er drie soorten leerdoelen onderscheiden; leerdoelen waarin beschreven staat wat iemand moet weten,
 3 leerdoelen waarin staat wat iemand moet kunnen en leerdoelen waarin staat hoe iemand zich moet gedragen. Vanuit het principe dat de
 4 beroepsbeoefenaar niet alleen vakbekwaam moet kunnen handelen, maar ook beroepsbekwaam moet zijn, worden deze drie soorten
 5 leerdoelen in de prestatiematrix vertaald naar de volgende handelingscategorieën:

- 6 • Cognitief – reflectief handelen
- 7 • Vakmatig – methodisch handelen
- 8 • Sociaal – communicatief handelen

9 *Bekwaamheidsniveaus*

10 De prestatiematrix ordent daarnaast leerdoelen naar drie bekwaamheidsniveaus:

- 11 • reproductief handelen
- 12 • productief handelen
- 13 • zelfsturend handelen

14 Hierbij wordt dus uitgegaan van een toenemende mate van zelfstandig en verantwoordelijk handelen naar zelfsturend handelen als
 15 eindniveau.

16 Op de kruising van cellen ontstaan negen algemene handelingsbekwaamheden die vertaald kunnen worden in leerdoelen.

		Handelingscategorieën		
		Cognitief – reflectief <i>Weten, denken</i>	Vakmatig – methodisch <i>Systematisch handelen</i>	Sociaal – communicatief <i>Communiceren</i>
	Reproductief handelen	Wat moet ik weten, begrijpen?	Wat moet ik kunnen?	Hoe moet ik me gedragen?
	Productief handelen	Wat moet ik kunnen bedenken, beredeneren?	Wat moet ik volgens plan kunnen uitvoeren?	Hoe moet ik samenwerken of omgaan met anderen?
	Zelfsturend handelen	Wat moet ik kunnen doen om te verbeteren?	Wat moet ik kunnen uitvoeren in de praktijk?	Hoe moet ik me kunnen verantwoorden?

17

18

1 **Taxonomie van Bloom**

2 De prestatiematrix laat de formulering van de leerdoelen vrij. Noordhoff Health gebruikt voor de formulering van leerdoelen en de hieraan
3 gerelateerde acties en producten de Taxonomie van Bloom.

4 In de Taxonomie van Bloom worden zes niveaus onderscheiden:

- 5 1. onthouden
- 6 2. begrijpen
- 7 3. toepassen
- 8 4. analyseren
- 9 5. evalueren
- 10 6. creëren

11 Met de niveaus wordt onderscheid gemaakt in de complexiteit van het kennisniveau waarop een beroep wordt gedaan. De eerste drie
12 niveaus behoren tot de 'lagere orde vragen', de laatste drie tot de 'hogere orde vragen'. In een rijke leeractiviteit worden meerdere niveaus
13 aangesproken.

14
15

Afbeelding B2.1. Taxonomie van Bloom

1
2
3
4

De niveaus van Bloom zijn te vertalen naar de bekwaamheidsniveaus van de prestatiematrix, waardoor deze twee taxonomieën als het ware in elkaar schuiven.

Prestatiematrix		Handelingscategorieën		
		Cognitief – reflectief <i>Weten, denken</i>	Vakmatig – methodisch <i>Systematisch handelen</i>	Sociaal – communicatief <i>Communiceren</i>
Bekwaamheidsniveaus				
Onthouden Begrijpen	Reproductief handelen	Wat moet ik weten, begrijpen?	Wat moet ik kunnen?	Hoe moet ik me gedragen?
Toepassen Analyseren	Productief handelen	Wat moet ik kunnen bedenken, beredeneren?	Wat moet ik volgens plan kunnen uitvoeren?	Hoe moet ik samenwerken of omgaan met anderen?
Evalueren Creëren	Zelfsturend handelen	Wat moet ik kunnen doen om te verbeteren?	Wat moet ik kunnen uitvoeren in de praktijk?	Hoe moet ik me kunnen verantwoorden?

5
6
7
8
9
10

In de Taxonomie van Bloom worden actiewoorden gebruikt bij de formulering van de leerdoelen. Hiermee wordt meteen duidelijk gemaakt op welk niveau het leerdoel zich bevindt. Voorbeelden van actiewoorden zijn: benoem, definieer, vat samen, leg verbanden, pas toe, onderzoek, analyseer, orden en ontwikkel. Voor een overzicht van welke vaardigheden, type leerdoelen en voorbeelden van formuleringen met actie horen bij ieder niveau, zie afbeelding B2.1 'De zes niveaus van Bloom'.

Een voorbeeld

Het invullen van de cellen uit de prestatiematrix volgens de formulering van Bloom gebeurt op basis van een hoofdleerdoel wat voor het betreffende leerpad is geformuleerd.

Het invullen van de cellen leidt tot subleerdoelen die bijdragen aan het behalen van het hoofdleerdoel.

15
16
17

Voor een student uit het initieel onderwijs is een leerdoel bijvoorbeeld:

Je kunt de zorgvrager op basis van het zorg(leef)plan bij de persoonlijke verzorging ondersteunen.

1 Dit leerdoel kan op de volgende manier vertaalde worden naar subleerdoelen in de combinatie van de prestatiematrix met de niveaus en
 2 formulering van Bloom:

3
 4

Prestatiematrix		Handelingscategorieën		
		Cognitief – reflectief <i>Weten, denken</i>	Vakmatig – methodisch <i>Systematisch handelen</i>	Sociaal – communicatief <i>Communiceren</i>
Bekwaamheidsniveaus				
Onthouden Begrijpen	Reproductief handelen	Je kunt de bouw en functie van de huid benoemen.	Je kunt de vijf aandachtspunten voor het ondersteunen van een zorgvrager bij de persoonlijke verzorging beschrijven.	Je kunt respect tonen voor de eigenheid en privacy van de zorgvrager en naastbetrokkenen.
Toepassen Analyseren	Productief handelen		Je kunt een zorgvrager ondersteunen bij uit- en aankleden met behulp van de vier uit- en aankleedtechnieken. Je kunt een zorgvrager ondersteunen bij wassen of baden.	Je kunt bij de persoonlijke verzorging actief rekening houden met mogelijkheden, wensen en gewoonten van de zorgvrager en naastbetrokkenen. Je kunt de zorgvrager en naastbetrokkenen op een overtuigende manier motiveren tot haalbare activiteiten.
Evalueren Creëren	Zelfsturend handelen		Je kunt observaties uit het zorgplan verrichten tijdens de persoonlijke verzorging.	

5
 6

- 1 **Hoofddoel:** Je kunt als KF Audioloog voor een volwassen zorgvrager de aard en ernst van een gehoorverlies vaststellen en
 2 deze relateren aan de klachten.
 3

Prestatiematrix EPA 1: Diagnostiek volwassenen		Handelingscategorieën		
		Cognitief – reflectief	Vakmatig – methodisch	Sociaal – communicatief
Supervisie eindniveau: 5		<i>Weten, denken</i>	<i>Systematisch handelen</i>	<i>Communiceren</i>
Bekwaamheidsniveaus				
Onthouden Begrijpen <i>Beschrijf, herken, benoem, interpreteer, vat samen, leg uit, classificeer, hernoem</i>	Reproductief Handelen	Wat moet ik weten, begrijpen? - (Patho)fysiologie van het gehoororgaan - Psychofysica van toon- en spraakaudiometrie - Biofysica van het gehoor - Theorie van toon- en spraakaudiometrie, met en zonder ruis. - Theorie van impedantiemetrie (tympanometrie en reflexmetingen) - Achtergronden tinnitus en hyperacusis/geluidgevoeligheid.	Wat moet ik kunnen? - Weten welke protocollen er zijn voor volwassenendiagnostiek - Weten welke onderzoekscodes bij welk onderzoek horen - Weten wat de werkprocedures zijn bij audiometrie	Hoe moet ik me gedragen? - Belang begrijpen van nauwkeurig werken - Duidelijk kunnen spreken, zo nodig aangepast aan de luisteraar (aangepast tempo, mondbeeld zichtbaar) - Weten welke vragen gesteld moeten worden om de klacht in beeld te brengen (oa relevante medische anamnese, audiologische anamnese)
	Toepassen Analyseren <i>Bewerkstellig, voer uit, gebruik, pas toe, vergelijk, organiseer, haal uit elkaar, ondervraag, vind</i>	Productief handelen	Wat moet ik kunnen bedenken, beredeneren? - Indicatie voor toon- en spraakaudiometrie (in ruis). - Indicatie voor maskeren bij toon- en spraakaudiometrie - Indicatie impedantiemetrie - Of een spraakaudiogram passend is bij een toonaudiogram (voor de gevonden perceptieve, conductieve of mogelijk retrocochleaire problematiek)	Wat moet ik volgens plan kunnen uitvoeren? - Het maken van een volledig gemaskeerd toon- en spraakaudiogram volgens protocol (niveau 'toepassen') - Zelfstandig kunnen vaststellen wanneer gemaskeerd moet worden bij toon- en spraakaudiometrie (niveau 'analyseren') - Het verrichten van impedantiemetrie, en controleren van de betrouwbaarheid.

			<ul style="list-style-type: none"> - Het volgen van het tinnitus-suisanalyse-protocol - Noteren van relevante bevindingen tijdens diagnostiek (zoals klachten zorgvrager of vermoeden van aggraving) - Duidelijke uitleg kunnen verschaffen over een audiogram aan zowel professionals als patiënten. 	
<p>Evalueren Creëren <i>Controleer, hypothetiseer, bekritiseer, experimenteer, beoordeel, ontwerp, maak, plan, produceer, vind uit, bouw</i></p>	<p>Zelfsturend handelen</p>	<p>Wat moet ik kunnen doen om te verbeteren?</p> <ul style="list-style-type: none"> - <i>In staat zijn om het eigen handelen kritisch te bezien</i> - <i>Herkennen van kwaliteit issues</i> - <i>Herkennen van kennis lacunes</i> - <i>Literatuuronderzoek kunnen uitvoeren</i> - <i>Op basis van theoretische kennis tot een oplossing komen voor de kennis- en kwaliteitslacunes.</i> 	<p>Wat moet ik kunnen uitvoeren in de praktijk?</p> <ul style="list-style-type: none"> - Op basis van zorgvraag kunnen bepalen welke metingen nodig zijn en tijdens een meting eventueel de onderzoeken aanvullen voor een goede diagnostiek, zo nodig buiten de standaard zorgprotocollen om. - Controleren/interpreteren van toon- en spraakaudiometrie, zowel zelf uitgevoerde als van collega's - Interpreteren van tympanometrie - Evalueren van de betrouwbaarheid van een suisanalyse. 	<p>Hoe moet ik me kunnen verantwoorden?</p> <ul style="list-style-type: none"> - <i>Juiste vragen kunnen stellen om zorgvraag helder te krijgen</i> - <i>Helder ideeën kunnen verwoorden</i> - <i>Collega's kunnen motiveren</i> - <i>Feedback aan collega's kunnen geven zodanig dat er een veilige leeromgeving is</i> - <i>Verantwoordelijkheid kunnen nemen voor de borging van de kwaliteit binnen het AC.</i>

1 NB: de schuingedrukte onderwerpen komen nog terug in latere EPA beschrijvingen, en vallen buiten het supervisie eindniveau van dit betreffende EPA.
2

- 1 **Hoofddoel:** Je hebt als KF Audioloog inzicht in het gehele zorgtraject van een volwassene met licht tot zeer ernstig
 2 gehoorverlies en kunt deze zorg als behandelaar binnen het multidisciplinair team zelfstandig uitvoeren.
 3

Prestatiematrix EPA 2: Hoorrevalidatie volwassenen Supervisie eindniveau: 5		Handelingscategorieën		
		Cognitief – reflectief	Vakmatig – methodisch	Sociaal – communicatief
Bekwaamheidsniveaus		<i>Weten, denken</i>	<i>Systematisch handelen</i>	<i>Communiceren</i>
Onthouden Begrijpen <i>Beschrijf, herken, benoem, interpreer, vat samen, leg uit, classificeer, hernoem</i>	Reproductief Handelen	Wat moet ik weten, begrijpen? - Basiskennis over de oorzaken van slechthorendheid en behandelmethoden - Kennis van meest voorkomende klachten bij gehoorverlies - Kennis van psychosociale aspecten rondom slechthorendheid - Weten hoe het hoorrevalidatieproces verloopt. - Kennis over verzekeringsmogelijkheden. - Kennis over hoortoestellen: verschillende typen, onderdelen en werking van – en signaalbewerking door hoortoestellen - Kennis over onderdelen en werking van BCD's - Kennis van oorstukjes: typen en materialen - Kennis over aanvullende hulpmiddelen: solo-apparatuur,	Wat moet ik kunnen? - Anamnese afnemen - Resultaten audiometrie bespreken en relateren aan klachten van de patiënt - Bespreken van behandeldoelen - Uitleg geven over het gehoor(verlies) en bijkomende klachten - Uitleg over het revalidatieproces, eigenschappen van hoortoestellen en hulpmiddelen, en aspecten t.a.v. de zorgverzekering - Real Ear Meting (REM) uitvoeren - Uitvoeren aanpassing en bijstelling van hoortoestel(len) - Recept opstellen voor hoortoestel(len) en overige hulpmiddelen - Administratie van het consult, waaronder het noteren van aantekeningen in het dossier en het uitvoeren van verrichtingen.	Hoe moet ik me gedragen? - Gespreksvaardigheden gebruiken zoals luisteren, samenvatten en doorvragen (LSD), om informatie te verzamelen over het leven met gehoorverlies specifiek voor de patiënt. - Het functioneren van de patiënt breed uitvragen en bespreken met als leidraad het ICF-model (International Classification of Functioning). - Omgaan met slechthorende patiënten, te weten goed articuleren, niet te snel praten, en patiënten goed aankijken tijdens het gesprek - Goed omgaan met dynamiek tussen patiënt en partner / familie / begeleiders. - Basisvaardigheden counseling toepassen, waaronder afstemming van informatie/communicatie

		<p>remote mic, TV-oplossing, waken waarschuwingssysteem</p> <ul style="list-style-type: none"> - Kennis over rekenregels: DSL, NAL-NL1, NAL-NL2. - Kennis over verificatie- en validatiemethoden (waaronder Real Ear metingen, spraaktesten met hoortoestellen, gebruik vragenlijsten) - Kennis over niet-technische onderdelen van revalidatie: psychosociale zorg, acceptatie, mentale ondersteuning, horen en luisterstrategieën, communicatie-ondersteuning en spraakafzien e.d. 	<ul style="list-style-type: none"> - Participeren in MDO 	<p>aan behoeften van patiënt, inclusief 'shared decision making'.</p>
<p>Toepassen Analyseren <i>Bewerkstellig, voer uit, gebruik, pas toe, vergelijk, organiseer, haal uit elkaar, ondervraag, vind</i></p>	<p>Productief handelen</p>	<p>Wat moet ik kunnen bedenken, beredeneren?</p> <ul style="list-style-type: none"> - In het verhaal van de patiënt benoemde en onbenoemde functioneringsproblemen herkennen die behandeling nodig hebben. - Beoordeel of de audiologische onderzoeken onderling een consistent beeld geven en passen bij de klachten - Opstellen van een (audiologische) diagnose op basis van de voorgeschiedenis, klachten en de onderzoeken - Vervolgbeleid bepalen o.b.v. audiologische en medische diagnose, rekening houdend met de wensen en behoeften 	<p>Wat moet ik volgens plan kunnen uitvoeren?</p> <ul style="list-style-type: none"> - Optimalisatie van de hoortoestelinstellingen bij verschillende types en mate van gehoorverlies op basis van beschikbare informatie (gehoorverlies, REM, spraakverstaan, ervaringen patiënt) - Uitvoeren van metingen om bepaalde klachten of defecten van het hoortoestel te kunnen adresseren. - BCD aanpassing en controle, waaronder metingen met de skull-simulator - Bespreken van revalidatiemogelijkheden, 	<p>Hoe moet ik samenwerken of omgaan met anderen?</p> <ul style="list-style-type: none"> - Bespreken van psychosociale aspecten rondom slechthorendheid met patiënt - Inleven in het effect van beperkingen - Belemmerende gedachten bij patiënten bespreekbaar kunnen maken - Patiënten kunnen motiveren waar nodig - Verwachtingsmanagement - Feedback van collega's kunnen vragen en ontvangen - Beleid afstemmen met maatschappelijk

		<p>van de patiënt, met aandacht voor de psychosociale kant.</p> <ul style="list-style-type: none"> - Indicatie voor BCD kunnen stellen o.b.v. beengeleidingsdrempels en otologische factoren - Audiologische indicatie voor CI kunnen stellen o.b.v. het auditief functioneren en (verloop) van het gehoorverlies - Weten wanneer de REM afwijkend is en waar dat aan zou kunnen liggen - Klachten van de patiënt relateren aan de resultaten van de REM en de instellingen van de hoortoestel(len) - Evaluatiemetingen met hoortoestel(len) beoordelen (met name spraakverstaan) en relateren aan REM, vragenlijsten en ervaringen patiënt. 	<p>inclusief CI als vervolgbeleid en doorverwijzing naar het CI-team.</p> <ul style="list-style-type: none"> - Doorverwijzing naar maatschappelijk werk, psycholoog, KNO-arts - Correspondentie naar verwijzers verzorgen - Contact met audiciens en andere behandelaren van de patiënt - Eigen casussen inbrengen in het MDO 	<p>werker/psycholoog en/of KNO-arts</p>
<p>Evalueren Creëren <i>Controleer, hypothetiseer, bekritiseer, experimenteer, beoordeel, ontwerp, maak, plan, produceer, vind uit, bouw</i></p>	<p>Zelfsturend handelen</p>	<p>Wat moet ik kunnen doen om te verbeteren?</p> <ul style="list-style-type: none"> - <i>In staat zijn om het eigen handelen kritisch te bezien</i> - <i>Herkennen van kwaliteit issues</i> - <i>Herkennen van kennis lacunes</i> - <i>Literatuuronderzoek kunnen uitvoeren</i> - <i>Op basis van theoretische kennis tot een oplossing komen voor de kennis- en kwaliteitslacunes.</i> 	<p>Wat moet ik kunnen uitvoeren in de praktijk?</p> <ul style="list-style-type: none"> - kunnen bepalen welke metingen nodig zijn en tijdens een meting eventueel de onderzoeken aanvullen voor een goede diagnostiek - Controleren/interpreteren van meetgegevens en verslaglegging, zowel zelf uitgevoerde als van collega's 	<p>Hoe moet ik me kunnen verantwoorden?</p> <ul style="list-style-type: none"> - <i>Juiste vragen kunnen stellen om zorgvraag helder te krijgen</i> - <i>Helder ideeën kunnen verwoorden</i> - <i>Collega's kunnen motiveren</i> - <i>Feedback aan collega's kunnen geven zodanig dat er een veilige leeromgeving is</i> - <i>Verantwoordelijkheid kunnen nemen voor de borging van de kwaliteit binnen het AC.</i>

1 NB: de schuingedrukte onderwerpen komen nog terug in latere EPA beschrijvingen, en vallen buiten het supervisie eindniveau van dit betreffende EPA.

2

- 1 **Hoofddoel:** Je kunt als KF Audioloog voor een kind de aard en ernst van een gehoorverlies vaststellen en deze relateren aan
 2 de klachten en aan het talig en algemeen functioneren.
 3

Prestatiematrix EPA 3: gehoordiagnostiek kinderen		Handelingscategorieën		
		Cognitief – reflectief	Vakmatig – methodisch	Sociaal – communicatief
Supervisie eindniveau : 4		<i>Weten, denken</i>	<i>Systematisch handelen</i>	<i>Communiceren</i>
Bekwaamheidsniveaus				
Onthouden Begrijpen <i>Beschrijf, herken, benoem, interpreteer, vat samen, leg uit, classificeer, hernoem</i>	Reproductief Handelen	Wat moet ik weten, begrijpen? - De ontwikkeling van het gehoororgaan en auditieve waarneming ook in relatie tot ziekten en syndromen - Theorie van gedragsaudiometrie (observatie, VRA, spelaudiometrie, toon/spraak, onderzoek van spraakverstaan in ruis) - Theorie van elektrofysiologische diagnostiek (BERA/ASSR, OAE) - Theorie van impedantiemetrie - Kennis van risicofactoren op gehoorverlies (infecties, syndromen etc) - Auditieve ontwikkeling kind normaal/afwijkend - Achtergronden spraak- en taalontwikkeling kind: normaal/afwijkend	Wat moet ik kunnen? - Weten welke protocollen er zijn voor audiologische diagnostiek bij kinderen: gedragsaudiometrie, elektrofysiologische diagnostiek, impedantiemetrie. - Weten wat de werkprocedures zijn bij kinderaudiometrie - Weten welke onderzoekscores / zorgactiviteiten bij welk onderzoek horen	Hoe moet ik me gedragen? - Belang van nauwkeurig en systematisch werken - Belang van afstemming op ouders die zorg hebben om hun kind - Belang van afgestemde omgang met neonaten en jonge kinderen - Weten welke vragen gesteld moeten worden om de klacht in beeld te brengen (oa relevante medische anamnese, audiologische anamnese)
	Toepassen Analyseren <i>Bewerkstellig, voer uit, gebruik, pas toe, vergelijk, organiseer, haal uit elkaar,</i>	Productief handelen	Wat moet ik kunnen bedenken, beredeneren? - Indicaties voor vormen van gedragsaudiometrie	Wat moet ik volgens plan kunnen uitvoeren? - Gedragsaudiometrisch onderzoek - Elektrofysiologisch onderzoek

<p><i>ondervraag, vind</i></p>		<ul style="list-style-type: none"> - Indicaties voor doorverwijzing naar KNO bij middenoorproblemen. - Samenhang tussen observaties van auditief functioneren en metingen op AC - Samenhang tussen resultaten audiologische diagnostiek en taalontwikkeling en algemene ontwikkeling 	<ul style="list-style-type: none"> - Impedantie-audiometrisch onderzoek - Systematische anamnese van auditief, talig en algemeen functioneren 	<ul style="list-style-type: none"> - Samenwerken met collega's bij gedragsaudiometrie en elektrofysiologische diagnostiek - Vanuit eigen discipline en overstijgend bevindingen bespreken met collega's binnen en buiten AC
<p>Evalueren Creëren <i>Controleer, hypothetiseer, bekritiseer, experimenteer, beoordeel, ontwerp, maak, plan, produceer, vind uit, bouw</i></p>	<p>Zelfsturend handelen</p>	<p>Wat moet ik kunnen doen om te verbeteren?</p> <ul style="list-style-type: none"> - <i>In staat zijn om het eigen handelen kritisch te bezien</i> - <i>Herkennen van kwaliteit issues</i> - <i>Literatuuronderzoek kunnen uitvoeren</i> - <i>Op basis van theoretische kennis tot een oplossing komen voor de kennis- en kwaliteitslacunes.</i> 	<p>Wat moet ik kunnen uitvoeren in de praktijk?</p> <ul style="list-style-type: none"> - Op basis van zorgvraag kunnen bepalen welke metingen nodig zijn en tijdens een meting eventueel de onderzoeken aanvullen voor een goede diagnostiek - Controleren/interpreteren van gedragsaudiometrie en elektrofysiologische diagnostiek en impedantiemetrie; zowel zelf uitgevoerd als van collega's - In multidisciplinair overleg anamnestiche en diagnostische resultaten in kader kunnen plaatsen en gezamenlijk tot integrale conclusie komen - Met ouders gesprek kunnen voeren over beleid obv audiologische en multidisciplinaire diagnostiek 	<p>Hoe moet ik me kunnen verantwoorden?</p> <ul style="list-style-type: none"> - <i>Juiste vragen kunnen stellen om zorgvraag helder te krijgen</i> - <i>Helder ideeën kunnen verwoorden</i> - <i>Collega's kunnen motiveren</i> - <i>Feedback aan collega's kunnen geven zodanig dat er een veilige leeromgeving is</i> - <i>Verantwoordelijkheid kunnen nemen voor de borging van de kwaliteit binnen het AC.</i>
